Now, I am using a MegaSTE on the Modem 1 port (the regular ST port, restricted to 19200). So, I have my baud rate set to 19200. It is possible that I am "filling the pipe" occasionally when reading text (that is, the text might occasionally come in at 1920 CPS, and be hindered by the 19200 line speed). However, it probably does not happen often, and I don't miss it a bit. With binary downloads, I might get slightly better performance from a setting above 19200 (as occasional "bursts" could come in faster than 1920 CPS), but this is relatively unlikely. In other words, if I managed to set that port to 57600, I would still probably get around 1650 CPS during binary downloads.

Now, you CAN go faster than 19200 on ST/MegaST/STE, but you have to make hardware modifications to the machine to do this. There are a couple of nifty mods out there. One is called RSVE. It is a home-brew (though you may be able to buy ready-made boards from somewhere). The instructions (including negatives for the board traces) are available on atari.archive in the Utilities/Tosfixes section. Another option is TurboRS. This will be a commercial product that should be fairly easy to install. A couple of guys in Canada are doing it (sorry, I don't have the names handy), and they intend to include an RSVE emulation mode. This is important, as RSVE is a semi-standard for faster-than-19200-on-ST ports. Several excellent software packages "look" for the RSVE extensions (Connect, for example).

If you have a MegaSTE or TT (and maybe Falcon), there are modem ports that can go up to 57600 on the machine already. In the case of MegaSTEs, a lot of them are buggy (mine are :-( ). They can be fixed, however. Instructions for this can be found in fser09b.lzh on atari.archive.umich.edu, in the above mentioned Tosfixes directory.

Again, I doubt that you will be able to achieve any major advantage from a 57600 data line, given that you are using a 14400 baud v.32 modem (very common). Once the v.fast standard is settled upon, this might change. The v.fast protocol has a 28800 baud line speed (x2 above), and supposedly has a potential of 10x compression (though that is probably _very_ potential, as with the 57.6k potential for v.32).

Of course, if you wanted to do some null-modem transfers, or were directly connected to something that could talk at 57600 continuous, you would experience a performance increase by upgrading your port. If I ever get my faster ports to work, I'll do a comparison and post the results.

Hope that helps.

I used Neodesk 3.x on my Mega2ST for years without unloading it for
execution. You can use the "about" menu item to get the blotter pad that
shows the amount of free memory available.

> _more expensive_ INTeL modem! :)
> Thanks a bunch!

No, not without hardware modifications (I remembering seeing a section of
the HSMOD docs that seems to indicate otherwise, but I think it is just a
translation mishap). HSMODA0x does at least three broad things:

1. Fix TOS bugs having to do with hardware flow control (RTS/CTS).
2. Optimize serial driver routines to obtain more performance from
existing hardware.
3. Support RSVE, a hardware modification that allows faster speeds than
19200 on ST ports. I believe it can also be made to support other
hardware speed mods, though it is not guaranteed to work.

You simply cannot get more than 19200 baud _reliably_ on a stock ST/STE
without making hardware mods. The good news is that the hardware mods are
not very difficult, and that there is soon to be a commercial product to do
this that should be very easy to install. See my other (big) post on
modem stuff for more details. Hope that helps.

Have you tried using the Neodesk clipboard? It is certainly robust, though
not as generally useful as a ramdisk. Depending on what you want to do, it
could be just the ticket.

> I also need a program to increase the size of my serial port buffers.

HSMODA04. Consider no others :-). It is available from atari.archive, as
are lots of ramdisks.

Perhaps, but in one 50Hz frame, the ST can move maximum 32k of data.
The F030 can only move twice as much, and that is what counts.

> force programs to use Serial 1? If so, is there a way to lock the speed
> on serial 1? Is there any other way to obtain 38400/57600 bps on a MegaSTE.

Yes. First, you can select which serial port maps to "modem 1" with the
xcontrol panel (the CPX needed should be included). Then, you can use
HSMODA04 to map 57600 to whatever "standard" baud rate you want. In other
words, you would still select 19200 or whatever, but it would really be
57600.

However, I personally find Connect to be superior to Stalker. There is a
lot to the program that is not immediately apparent (you need to read lots
of help pages, or register it and get the manual to find them). With
NVDI, and my MegaSTE set to 16mHz, it is very nice indeed. Just my $0.02.

If the demo was designed to run on a TV, it is not possible because the
VGA-mode eats to much bandwith (more than twice as much as the TV does).

3714. Falcon F-16 flight sim on MegaSTE

Newsgroup: comp.sys.atari.st
Date: 1994-05-31 15:54:30 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2sfmjm$r00@mailer.fsu.edu>
Source record: 186288

I was rather looking forward to some null-modem Falcon F-16 on my MegaST
and new MegaSTE. However, both my original Falcon and my Operation
Counterstrike mission disk seem to have problems on the MegaSTE.
Counterstrike gets much farther, but it still dies before any flight
is achieved.

So, has anyone gotten Falcon F-16 to work on:

a 1040STE
a MegaSTE w/2.06

Also, I seem to remember reading about some hacks that enabled one to install
Falcon on a hard disk. Does anyone have the instructions handy? Thanks in
advance for any help.

Oh, for those that have not tried it, Falcon on two machines (null modem) is
extremely cool. It is definitely worth the trouble to set up!

That's ridiculous, Ian. Sure, Bob has made his share of goofs, has spoken when he should have kept quiet, inadvertently passed out false or misleading information, etc, etc. He has made me angry with the occasional inappropriate public statement too. But I still count him among my friends.

The fact is that Bob Brodie was (and is) an Atari USER and he always kept that in mind when dealing with the public. He was good for Atari and he was good for us (users _and_ developers). He worked very hard for us under less than ideal circumstances (putting it mildly) and frequently put his job on the line when he had an opinion that differed from one held by the Tramiels. He is leaving Atari on his own decision due to personal, family considerations and I for one wish him the best of luck in all his future endeavors.

He will be missed.

-Hutch- @ Fair Dinkum Tech

P.S.: Those that appreciate Bob's efforts at Atari might wish to send him a short 'thanks and good luck' message at bob-brodie@genie.geis.com.

>complementary tickets!!

I must admit I was a bit dismayed at the size of the event. Luckily I had
a complementary ticket too. HiSoft had the only *proper* show stand, but
all in all there was enough Atari stuff there to make it worth visiting.
System Solutions didn't seem to be there which was a bit unfortunate.

Got to see my first Falcon in the flesh. Disapointingly slow in colour modes
(as expected) :-(Somehow I don't think I'm about to buy one.

Roland.

>GCC absolutely will not run without a HD.

Not true.

With 2.5 Mb of RAM and twin 720K floppies it *is* possible to run GCC
without a hard disk.

I haven't done it myself, but have talked to a couple of people who have
had 1.36, 1.37 and I believe 1.40 running successfully in this manner.
Anything later is just too large.

Its not pretty or much fun though.

:-)

Roland.

>aren't hard ones :) So here we go again :

Well - for what its worth (my opinion that is ;-)

>A) Is there any way to read Macintosh disks and files (simple plain vanilla
> ASCII, I'm not _that_ optimistic) without buying Spectre

No.

>BTW what is Aladin ?

Another Mac emulator which ceased production a long time ago. There was
a sort of Aladin translator cartridge which would read Mac disks - so you
might be able to get hold of one of those.

>Can I use these 32bit SIMMS to get 2.5Mb ?

No.

I just don't think you will be able to fit them in you SIMM slots.

:-)

Roland.

>I have just acquired an ST FM. It has 512kb of soldered ram. I would like
>1-4mb of ram.

You would probably be better off getting a SIMM cage from Marpet. If you start soldering in RAM now, and at a later date decide you need more than 1Mb of RAM, then you will have to undo this upgrade. With a Marpet SIMM cage, you just plug in SIMMs like you do on an STE.

:-)

And even if you do have an application that needs that little bit of
extra RAM, you can always set Neodesk to unload itself for that one
program only. I have about three or four programs set up like that (mainly
DTP) and the rest leave Neodesk resident.

: In a non interlaced rez the other set of scanlines, as you refer to, is a
: completly new frame! So you will get 50 or 60 fps!

This correct, but the interlaced set is considered part of the same frame,
because they do not lie in the same positions as the frame before, but rather
between them.

In non-interlaced on a TV, you get 30fps.

In interlaved in a TV, you SORTOF get 60fps, but on a skewed set of scanlines.
You get 60 fields per second, making 30 frames per second.

How about an update to MultiTOS... like to make it run at a tollerable speed?

3737. Help needed: convert "Fastbase"->"Adresse1.8" data

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 00:19:18 UTC
From: hallvart@ifi.uio.no
Message-ID: <2sgk66$mau@solva.ifi.uio.no>
Source record: 186235

I've gotten hold of the excellent address database "adresse 1.8" by
Carsten Setje Eilers.
I've previously used "Fastbase", and have all my addresses there, but
want to export them into "adresse".
The "export" function of "Fastbase" works fine- it makes a file with a .CSV
ending after, but the problem arrives when I try to re-load the data into
"adresse". I have tried all sorts of combinations with the formats, but
my addresses seem to be spread all over. I don't really feel like typing
in all of my addresses into "adresse" again, when I have them in "fastbase", and
as all the documentations for "adresse" is in German I don't understand much (the
program itself however has an English resource file).
Can anybody help me with this? I have the format listed, I just need to know how to
set it up.

Hallvard, Oslo, Norway

3738. RESULT: comp.sys.atari.announce moderated passes 266:33

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 00:51:07 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.announce-RESULT@uunet.uu.net>
Source record: 186249
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.8bit,maus.sys.atari.hardware,maus.sys.atari.software,maus.sys.atari.talk,ctdl.sys.atari.st,fido.ger.atari,fr.comp.sys.atari

RESULT
moderated group comp.sys.atari.announce passes 266:33

There were 266 YES votes and 33 NO votes, for a total of 299 valid votes.
There was 1 abstain.

For group passage, YES votes must be at least 2/3 of all valid (YES and NO)
votes. There also must be at least 100 more YES votes than NO votes.

There is a five day discussion period after these results are posted. If no
serious allegations of voting irregularities are raised, the moderator of
news.announce.newgroups will create the group shortly thereafter.

Newsgroups line:
comp.sys.atari.announce Atari related hard/software announcements. (Moderated)

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Sui <ysiu@lexicor.com>

CHARTER (Yat Siu)

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hardware and software
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

Yat Siu (Lexicor@world.std.com) will be the moderator.

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three
groups are discussion forums for their (specific) related hard and
software. Product announcements in these discussion forums of new
releases by either commercial, shareware groups can often be
considered a service but not encouraged. The atari computer market is
not very widely distributed and it is getting increasingly harder to
know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari
computer users. It will also allow the reader to focus for a new

newsgroup only for product announcements or press releases and will
also make the reader more aware of his/her options.

comp.sys.atari.announce Final Vote Ack

Do NOT use this as a mailing list. Voters are not necessarily
interested in receiving email about the subject of the vote, and some
may react rather violently and try to get your account pulled.

Voted Yes

3740. MIKNET for Atari and IBM????

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 01:44:18 UTC
From: tekmar@oar.net
Message-ID: <2sgp5i$bto@dialup.oar.net>
Source record: 186234

All,

Someone mentioned a few days ago that there exists a version of MIKNET that allows an ST to network with an IBM system. I have a version of MIKNET that allows two ST's to network together, but no IBM connection.

I would appreciate someone dropping me an email message if the program exists somewhere on an FTP site on the net. I really need the ability to link my TT and 386 together right now.

Mike Hill
tekmar@oar.net

"ARM Risc chips are used in the Apple Newton, and I think in
some new Lazer printers...."

An ARM chip is also used as the CPU in the 3DO machine(s).

3742. Re: Double Q: 32bit SIMMs and Mac disks

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 03:23:41 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <5u8u+1V.lmcclure@delphi.com>
Source record: 186160

In a message date 5-31-94, Roger Sheppard said:

"You need 8 bit SIMMS, or mod the STE to use 9 bit SIMMS, the
unused 9th bit must have the inputs terminated to 0v or +v,
so just connect pins 28,29 and 30 together....pin 30 is +v...."

What is supposed to be the effect if you don't do this? This is the first time I have ever heard of a mod being suggested to use 9-bit SIMMS in an STe.

Seeing as my STe is currently running with a mix of two 8-bit SIMMs, and two 9-bit, and has not had any problems, it would seem to be unnecessary. Perhaps Atari already tied the connections you mentioned to ground?

3743. NVDI2.5 + BlowUp030 question

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 03:27:55 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <Cqp8AJ.pn@freenet.carleton.ca>
Source record: 186164

I am using (trying to :-) NVDI 2.5 and the demo version of BlowUp030 but when I boot up in my BlowUp resolution (880x560) the screen is completely garbled. When I change to any of the other regular modes everything works very well. I greatly would appreciate any help .

Also is there a newer version of NVDI I can upgrade to (or patches) if I encounter any problems? (I haven't yet but I'm sure I'm bound to :)

Lastly, where can I find some other fonts for NVDI?

thanks

(I never realized it would be this fast! :-)

>Have you tried using the Neodesk clipboard? It is certainly robust, though
>not as generally useful as a ramdisk. Depending on what you want to do, it
>could be just the ticket.

I LOVE the NeoDesk clipboard, except that it won't let me run programs
stored on it--I wanted a RAMdisk solely for un-LZHing big files (since I
still haven't gotten a bigger HD and I wouldn't want to frag it up, anyways).

I wiped out all of my old RamDisks (RAMBaby comes to mind) when I went from
my Mega2 to a MSTE4 (the major HD crash also had a lot fo do with that),
and therefore am looking for a good MSTEable RAMdisk...

>HSMODA04. Consider no others :-). It is available from atari.archive, as

Got it from Paderborn (ftp to aaue was busy, as usual, and I still hadn't
figured ot that I could gopher to it)...

Thanks a lot!

> Please help! I've seen this rate done on a friends PC with an
> internal card 14.4 modem and would _really_ like it here at home on my
> _more expensive_ INTeL modem! :)

Sorry, but the normal ST's can do only 19200Bps at maximum. HSMODEM doesn't
change this fact, it replaces only some faulty serial routines and speeds
up some interrupt handling things, that you will get maximum performance
also with standard 8 MHz ST's.

But there is a small hardware serial speeder called RSVE from the author
of HSMODEM (and compatible from others, too). It maps three of the never
used slow rates 110Bps, 134Bps and 150Bps to the faster ones 38400,
57600 and 115200. For the case that you've installed RSVE, HSMODEM
can install a cookie called RSVE.
Other programs can recognise the speedup hardware then and offer
the new Bps-rates directly in menues like CoNnect does.

Nevertheless, the slow 8 MHz ST's can handle rates only up to 38400Bps with
RSVE and HSMODEM, but with accelerator cards you can go up to 115200Bps.
I use 57600Bps, because my modem can't do it faster.

Greetings,
Stefan

3752. Screensaver/Speed up?

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 09:35:40 UTC
From: huveneer@math.ruu.nl
Message-ID: <1994Jun1.093540.24227@cc.ruu.nl>
Source record: 186293

Hi,

I'm looking for the most simple screensaver you can imagine:
It should make the screen black after a certain time of inactivity.

I now use Dave Baggett's screensaver which switches colors, which is not very pleasant in the dark.
But I do like the smallness of the program (it uses only 3K!).

Yes, I know I could write this myself, but hey, why bother if one of you knows where to get it.
Perhaps someone has the source code of Dave Baggett's screensaver?
An alternative is to hack his executable, but I don't like that solution.

A related question:

Several years ago I programmed the Atari 800 XL.
For this computer it was possible to disable screendisplay alltogether (I don't remember which POKE that was), increasing computing speed with about 20%.

Is there a similar mechanism in the Atari ST?
I'm really interested in this, since my Atari is spending most of his time computing.

Thx,

Richard.

Nope! Unfortunately, Spectrum Holobyte's FALCON doesn't work on
ANYTHING other than a standard ST (i.e. no STE/TT/Falcon!). SH
isn't interested in making a 'fix' for it either, so unless some
hackers here want to do it, you can ONLY play it on a plain old
ST.

True, it is definately the best editor I have used...

The first one I tried didn't like NVDI (Bad start) and was unusable as well...
(Didn't let you create icons)...

The second one I tried the actual editor screen was so small I strained my
eyes.....

But ICDRAWUP.ZIP (Could be LZH) is definately the best so far....

Neil.

My usual approach to finding someone's Email address is to phone them
up and ask. This won't work with the FaST club because their phones
are always engaged or unanswered.

>very well. I greatly would appreciate any help .
>
>Also is there a newer version of NVDI I can upgrade to (or patches) if I
>encounter any problems? (I haven't yet but I'm sure I'm bound to :)
You don't need an upgrade to NVDI. I have v2.5 running with BlowUp030
(at approx 960x560). It depends on the ordering of NVDI and Blowboot in
your AUTO folder; I can't remember which should come first (Blowboot, I
would guess), but one way works and the other doesn't! So, reorder
your AUTO folder.

>Lastly, where can I find some other fonts for NVDI?
There are numerous free GDOS fonts on many ftp sites.

Have you tried Atari's MACCEL3. It's a mouse accelerator, but
also is a screen saver. I believe it simply inverses the colors on
my screen every so often when the saver kicks in (in monochrome
mode anyways)...

Either that, or I'm going crazy (no comments, please :-)

>above mentioned Tosfixes directory.

Just to confirm. The Falcon's serial port can, indeed, go up to 57600. In
fact you can set it even higher (up to some ludicrous speed) but I doubt
if the Falcon can actually cope with much over 57600.

Thanks for such a clear explanation, Mickey, I'm sure it'll be of great
use to a lot of people. Maybe it should be included in the FAQ?

Source record: 186299

On 19 May 94 at 16:52:21, Bob did truly state.....

BL> We have seen this occur on several Falcons attached to either
BL> Archive Vipers or WangDAT. If this occurs on your Falcon then check
BL> your termination, make sure that the resistors are seated properly
BL> and in good shape, turn on termination power jumpers if your drive
BL> provides them. Then turn the components on in sequence first the tape
BL> drive and then the Falcon. The drive should be recognized normally.
Thanks for your suggestions Bob, I shall take my mini-tower case apart and check my SCSI devices terminations and power them up seperately (currently everything powers up together when I throw the switch on the tower case!)

I have also failed to get Diamond Back 3 working with an Archive Viper. HiSoft tried blaming it on the Falcon's SCSI implementation, or termination etc, but the same tape drive works fine with other software (eg GEMAR). Investigations still continuing...

I imagine that the official version of 1.11 will load the gem.sys AES.
If you want MiNT without the MultiTOS AES, you may need to compile your
own version. I'm not sure if it will be possible to distribute several
binaries of 1.11. Probably not - from Atari's point of view, isn't the
main reason to update existing MultiTOS users?

Apparently, there exists a 4.1 version of the MultiTOS AES (as opposed to the 4.0 version shipping). This has been given to (selected?) developers and is faster than the 4.0 version. It may have some other bugs. As far as I know, development of the AES has been put on hold. Anyone out there care to write a freely distributable version of the AES? :)

Some Falcons do not provide correct/stable termination power out of pin 26. For these Falcons ID recogniotion can be a problem if everything is powered up at once, try powering things up sequentially(i.e. first the tape drive and then the Falcon). Also your Archive Viper ships from the factory with termination power disabled. Enabling termination power for the Archive is done with JP12. This has also solved some Falcons problems.

3787. Re: NVDI2.5 + BlowUp030 question

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 15:53:47 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <Cqq6to.HEB@freenet.carleton.ca>
Source record: 186209

In a previous article, djs@jet.uk (David Stevenson) says:

>You don't need an upgrade to NVDI. I have v2.5 running with BlowUp030
>(at approx 960x560). It depends on the ordering of NVDI and Blowboot in
>your AUTO folder; I can't remember which should come first (Blowboot, I
>would guess), but one way works and the other doesn't! So, reorder
>your AUTO folder.

Thanks. I checked my mail this morning before leaving for work and I was
informed by many very nice NVDI users that NVDI has to run before BlowUp.
Indeed when I copied BLOWBOOT.PRG to the end of the folder everything
worked very well when I rebooted. (even with MTOS :-)

Thanks go out to all the people who responede to my querry. :-)

I have one other question: what can I do to get the Atari Collor CPX to
load the default collors when I have the NVDI CPX's installed?
One the machine has booted in those ugly default collors I can go to the
COLOR CPX and reload them myself but I would like it to be done automatically.

thanks again

3790. NVDI screen accelerator on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-06-01 16:07:56 UTC
From: ac382@FreeNet.Carleton.CA
Message-ID: <Cqq7H8.HtB@freenet.carleton.ca>
Source record: 186210

This message is geared mainly towards Falcon owners who think that their screen updates are a little slow or their terminal screen doesn't scroll fast enough. This become even slower if you have BlowUP 030 or screenblaster installed. Whether you have Warp9 or are strugling with the regular VDI you should seriously consider purchasing NVDI (IMHO).
The installation was a snap, the manual brief and to the point and the results are astounding! The only problems are with arranging your auto folder programs correctly. (basically NVDI goes after programs such as superboot and before BlowUp030/Screenblaster)

Warp9 doesn't compare! NVDI works well in ANY resolution and collor depth and it works with MultiTos.

You have to see it to believe it.... :-)

: ; Instruction cache on
: ; Data cache off

: loop: move.l (a0)+,(a1)+
: dbra d0,loop

On the 68000, you don't have an instruction cache, so the instructions have to
be loaded every time. On the 68030, they are loaded once. But on the 68030,
this is faster:

```
loop: move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
dbra d0,loop
```

It's actually MUCH faster, in fact.

It would hardly ever be used, for one. I mean, it's not like Atari goes
out of their way to post product announcements -- and since they're not
going to be making any new computers (for the time being, at least), the
only thing they could post is video game news which isn't exactly
something that video gamers are going to see.

In article dck@mother.usf.edu, millert@undergrad (Timothy Miller) writes:

}Actually, at 50hz, you get 25fps, and at 60hz, you get 30fps. Interlacing,
}remember.

At 25 fps and 30 fps, you get un-smooth animation. Believe me, or ask
whoever you want that coded some demo/game.

}
}One of the excuses given for 50hz demos is the extra time allowed between
}display refreshes. On the ST, this was very helpful, and something I proved
}to myself when trying to write my own sort of graphics demo.
}
}However, on the Falcon, a much faster machine, this should no longer be
}necessary. There should be plenty of time durring the vertical blank at 60hz

You seem to forget one thing : the more you get power, the more you need
power, the more you use power. If you do on Falcon what you did on ST, then, OK, you can
do it easily at 30 fps. If you want to make Falcon demos/games, you'll try to push the
beast as much as you can, using every single bit of CPU time ! (Just look at game coders
on PC : the more power they get, the more they want : I've heard of two games that can
run properly on Pentium only !)

}to get the work done, regardless of the fact that 320x200xTC has 4 times as
}much data to manipulate than ST low.... most ST demos were full screen, while

4 times as much data means :

- 4 times more bus bandwidth used
- 4 times more to draw
- 4 times more to clear

}most Falcon demos I've seen work in a little window on the screen.
}
}The Termfin demo worked very nicely on my TV!
}
Yes, but it is in line-doubling => 320x100!xTC => half the bandwith, the
drawing, etc...

I think some of you miss the point of why Comp.sys.atari.announce was created in the first place (or to be that is)

I enclose again a copy of the RFD of WHY comp.sys.atari.announce was meant to be created...it was NOT only for atari corporation, it is for atari developers, atari magazines, software, shareware, pd, commercial, shows etc.

Atari Corporation is not doing to much for their developers and computer users as they are concentrating on the Jaguar...so developers and users need to help themselves...this is only on of the steps to help existing atari computer users...

It is meant to separate the news of new releases with the discussion followup in comp.sys.atari.st.

Cheers

Yat

Proposal for a new newsgroup
Request for Discussion: comp.sys.atari.announce

by: Yat Siu (Lexicor@world.std.com)

Group name: comp.sys.atari.announce
Status: moderated (Lexicor@world.std.com)
Distribution: world-wide

Summary: a newsgroup for the product announcement of atari computer
hard and software or related (eg. clones).

Justification:

There are currently comp.sys.atari.st, comp.sys.atari.st.tech,
comp.sys.atari.8bit and comp.sys.atari.advocacy, the first three groups
are discussion forums for their (specific) related hard and software. Product
announcements in these discussion forums of new releases by either commercial,
shareware groups can often be considered a service but not encouraged. The
atari computer market is not very widely distributed and it is getting
increasingly harder to know more about new products.

To begin with a product announcement group would encourage the
people to announce their new products for the benefit of all atari computer
users. It will also allow the reader to focus for a new newsgroup only for
product announcements or press releases and will also make the reader more
aware of his/her options.

Charter:

The proposed group will provide a forum for the announcement and
release of new atari related products:

* atari computer hard and soft
* commercial as well as shareware or related
* announcement from individual authors, companies or distributors
* press releases

NOTE

This RFD is being issued in concordance with the guidelines set in the
"How to create a new usenet newsgroup" FAQ regularly posted to
news.announce.newgroups. Please refer to this article if you have any
questions about the newsgroup creation.

Unless the discussion indicated a need to resubmit a new RFD, the CFV will
be posted approximately three to four weeks after the posting of this RFD.

This RFD was (cross)-posted to the following groups:
news.announce.newgroups, news.groups, comp.sys.atari.st, comp.sys.atari.8bit

> or Calamus?

Yes, according to the readme file for Pagestream 2.2:

---begin included text---

[....]

Plotters and Sign Cutters

PageStream 2.2 has a new HPGL driver for printing to plotters and sign cutters. Instead of using limited specialty software on MS-DOS computers, you can have access to all the features of PageStream and push your plotter or sign cutter to the limit. (This is an excellent small business opportunity!) All of PageStream's features will work except for bitmap pictures which cannot physically be reproduced by plotter pens, and Compugraphic fonts which are incompatible at this time.

This driver has several command options which you can enter in the Special text field in the Configure Printer dialog box:

color: will switch pens if included. (Other wise will print entirely in black.)

fill: will print solid objects as solid. (This is suitable for small objects.)

stroke: will outline all objects and text with a black line.

The fill and stroke options are not applicable to sign cutters. If you are using a Roland CAMM1 sign cutter, an additional command has been provided for full compatibility:

camm1: will provide compatibility with the Roland CAMM1 sign cutter.

It may be the case that Calamus can as well. I'm sure Dynacadd can, see below.

> 2. Are there professional-level CAD programs available for
> the ST? (He's bought most of the <$100 ones that have
> come along over the years, but none have been able
> to do the detailed house plans and landscape designs
> he needs.)

There is (or was) at least one: Dynacadd. It was comparable to AutoCAD several years ago. However, I don't know if it is still supported, and AutoCAD has definitely matured in the last couple of years. I seem to remember that Dynacadd had some wizz-features that sparked some reactions of "Get me whatever I need to have THAT", but this was several years ago.

To my knowledge, AutoCAD is quite the king in the PC CAD market. You have to go to a RISC based Intergraph workstation to get better (which is a major price jump). Thus, it is quite unlikely that Dynacadd could really compete with the newest versions of AutoCAD. On the other hand, Dynacadd was a pretty good CAD program a few years ago, and is probably still quite useful. Note that this is one of the few programs that can make good use of a floating point coprocessor, and it might be quite slow on an 8mHz ST/STE. Also, it is old enough that it might have problems running on newer (M)STE or Falcon. I seem to remember that it worked fine on a TT, which was the prefered system.

> He's also in the national guard and does drafting there using
> AutoCAD and a large flatbed plotter, so he may be spoiled
> by these expensive tools... How close can we come with an
> Atari solution?

I suggest you have your friend post some "wanted ads" on Genie, Compuserve, misc.forsale.computers.wanted, Current Notes magazine, etc. He might be able to pick it up for quite cheap (it listed for around $500, I seem to remember).

Note that I am not an architect. The above is scuttlebutt that I have picked up from various sources. Hope it helps, though.

> north of France or west of Germany, I'd like to have it.

There was a good series of articles on high-end graphics boards in the March and April 1994 Current Notes magazines. Here is a very brief summary of the author's conclusions:

NOVA, by Lexicor - by their own admission, it only works on 50% of TTs out there. They are not particularly cool if yours is not one of them (no refund). Author was not at all please at this, and raged on the company bigtime. Amusing reading, by the way.

Crazy Dots II, distributed by Gribnif in US - Can change modes during boot, offers a bunch of resolution/color-number combinations. Has some compatibility problems with software that supports 24-bit color modes. Fastest board, according to Qindex. Does not yet support 24-bit color (but should with upcoming software upgrade). Max res for 256 colors: 1024x768. Max res for 15-bit color (?): 800x600. In mono, up to 1664x1200 (!!).

Cyrel Sunrise, by Cybercube Research, Ltd - compatible with all 24-bit software tested, offers few mode choices, comes with cool color utilities, can use graphic pads or serial mice. Max res for 256 colors: 1600x1200. Max res for 16.7 million colors (24-bit color): 1024x512. No mono mode.

I suggest you try to get a copy of these two magazines and read the full articles. Here are the company addresses for the above mentioned cards.

I didn't mean to imply that I thought SMS2 was a port of the QDOS OS. I
meant 'implementation' in the sense that SMS2 implemented QDOS functions
thus allowing some QDOS programs to run. In the same way that DR DOS
implements MS DOS functions - but isn't actually a port.

No

>bottom line is: I've got a cdrom and a TT with tos 3.06 NO MULTITOS and
>I'd like to get photo-cd's visual with say GemView...

You need a copy of MiNT. Versions up to .95ish are available by FTP. After
that you need to compile your own from the sources (also available by ftp).
I haven't had any luck with .XFS drivers on MiNT above 1.04.

Ypu don't need MTOS, but the MiNT 1.04 supplied with MTOS (at least in the
UK) worked well with the .XFS drivers I tried.

Haven't tried any photo CD stuff as I only have a MSTE.

:-)

Roland.

BN> what is Aladin ?

Take a look at MacSee by Alan D. Reeve, in Europe DMC sells his programm. It
works only with 1.44 HD floppydrives and 44 Mb Syquest cartridges.

>adjust your TV or monitor so that it's close enough to both not to care. If
>not you have to rely on switchers.

Sorry to disagree with you Dan, but I think you're painting an incomplete
picture of the situation here. There are a number of issues, and you only touch
on a couple of them.

There are certainly a number of European demos written that assume a 50 hz
refresh rate, and don't actively set the refresh rate themselves. When you run
these on a US machine at 60 hz, the screen rolls, but this is generally caused
by a "side-effect" - a 50hz screen has more scanlines per screen than at 60hz.
Demo code that's counting hblanks and such will get screwed up mainly for this
reason; then when you run a program that switches your ST into PAL mode this
problem will generally go away.

But there's a second problem - few modern US TVs will sync properly to a 50hz
video signal. Back in the analog days it was pretty simple to tweak a TV so
that you could fake it and get by, but modern TVs with digital picture control
circuitry won't cut it. Generally the modern TVs have a digital scanline
counter; the TV "knows" that it's only supposed to get 262.5 scanlines per
field, and when it gets the 315 scanlines per field that a 50 hz video source
puts out, it's just going to choke. The image rolls, and no software switch in
the world can fix that.

On my Sony XBR TV, I can put the set into service mode and adjust the refresh
rate from the remote control, but the set has to be powered off and on for the
changes to take effect, and there's no middle-ground position that works for
both 50hz and 60hz. On my other Sony TV, there's no adjustment at all, so I'm
pretty much stuck to using an SC1224, or using my Multiscan monitor with the
SC1224 video adapter block...

> Again it's not that big of a topic. If you have the problem adjust your
>set or run a switcher.

I agree it's not that big of a deal, but then again, I just wiped out the
demo tree from my hard drive. I got tired of unpacking code that said "must be
run with a TV or RGB monitor" or this/that/th'other... The fact is, there's a
lot of interesting stuff out there that cannot be used by a large portion of
the user base, and it's a shame.

Hm, I don't actually remember if I ever ran it on my 1040 STe, but I think it worked OK. I for sure haven't tried it since installing TOS 2.06 though.

I used to run Falcon off my hard drive on my Mega ST; the original trick I used was to use the Supra boot code because their driver was very small, and the Falcon booter loaded at a fixed absolute address in low memory. The ICD and AHDI booters were too large and the Falcon code would overwrite them, after which point the hard drive was unusable... Later on I disassembled the booter and just reassembled it as a relocatable program.

I kept meaning to finish the job and disassemble the rest of the game, particularly since Falcon doesn't run on my Falcon, but never got the time. It was kind of a pain, there's a bit of self-modifying code, etc. (probably one of the main reasons it fails on the Falcon's 68030, hm...), but not much else that I recall.

No, on a STE that I had to replace the SIMM sockets, those pins were no
connected, I suguested +v as this is next to these pins and is very easy to
link across...

Check on a Cmos data book, all unused inputs must be connected to 0v or +v,
if they are not, the device can draw large amounts of current and the device
will get hot, and damage its self....

The Compendium documents the system calls that access the DSP, but you will
still need a 56001 reference for actual programming info; just as you would
need a 680x0 reference if you wanted to program the CPU in assembly...

>
>Does anyone know anything about the UNIX windows program uw.prg?
>I've downloaded it onto my machine and have got all the bits for
>the UNIX end but dunno how to run it. I have tried from the auto
>folder and running the startgem.prg supplied but it comes up with
>2 bombs.
>
>it is just a dodgy unarchived file or what?

First make sure you are using a monochrome resolution.

Second, don't use startgem - just run the executable WIN.PRG. Running
that will put you in a pretty typical terminal program. You can edit func.
keys, set terminal speed,etc. You cannot change the port number if you are
using a TT or Falcon so make sure the modem is on Modem1.

Third, login to your host site as per normal. Download the uw archive
at atari.archive.umich.edu (I'm not sure which one) and untar the unix source
distribution. You will need to compile these on your host, and will require
modification of the Makefile. You need to change the lib and bin dirs so you
don't try to write to /bin. :) BTW, I have tried to compile this on AIX
(IBMs version of UNIX) and was completely frustrated. Unless you are a C
guru, I would not recommend it.

Fourth, once you have a compiled binary (called uw I believe), place
it somewhere safe and delete all the source files/directories. You can run
this anywhere but wherever you run the binary becomes your "root" directory
where each succeeding window starts up in. You may want to run it first to
make sure it works, then delete the files.

Fifth, run uw. You will want to make sure that your emulation is
adm31 (just do a "setenv TERM adm31"). It (the ST host) does not do VT100
but the adm31 is a reasonable substitute. There is no real messages that
say it is running, it just goes to the next command line - only by opening a
new window will you know that it is working.

At this point you can create new windows using the pull-down menus.

When you logout, don't forget to "quit-proto" first so that the uw
program is quit, then you are in standard terminal mode and can quit as per
normal.

>Cheers
>
>Davie
>

>
>--

Hope that helps.

Also, will they (or perhaps someone already has) release the source
complete (so all I have to do is download and compile)? Normally I'm not this
lazy but I am not very confident with patches, and since I am already having
problems compiling the Mint 1.09 sources, I think I may have let a bug creep
into my compiler setup.

S> Any ideas anyone?
S>

Definately Go with Calamus SL, the best DTP program on the computer market,i have worked with DTP on the IBM and MAC but nothing beats calamus. in fact DMC have just released it (or are about too) for the IBM market.

You could go with a descent HP laserjet printer, excellent reproduction, depends on your needs and budget though, they are very resonable priced, i would go with something either 300 or 600 dpi , 600 being are far superior quality when printing small text and photographic images, you could even go for the colour version?

In a similar vein as my request for Empire maps, does anyone have any
Paladin quest files they'd like to share? If there's enough interest,
maybe I could collect them all and the upload a big archive to aa.umich.

Thanks!

If the MegaFile 44 is a standard SCSI-type SyQuest drive, advise your
friend that they can be had for as little as $199 here in the States,
while new carts sell for about $60 (used for as little as $25).

-Steve

3828. SC1435, pinouts?

Newsgroup: comp.sys.atari.st

3829. Info on Falcon towers needed

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 08:13:12 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <2sk4ao$a0v@nyheter.chalmers.se>
Source record: 186156

I'm looking for information on tower cases for the Falcon. I`ve seen a couple of firms selling such things in STComputer, but there is never close to enough information in those adverts.

Hard & Soft's Falcon BIG Tower is the one I'm most interested in, but if anyone knows anything about another one, please let me know.

Some things I`d like to know more about:
- Are all ports extended by cables, or are there simply holes drilled to make them available?
- I hope it's possible to add a SCSI drive without routing a cable back in.
- Can BlowUP030 be fitted inside?
- Keyboard?
- How many drives can be added?
- Quiet fan?

I'd really appreciate some answers to this as quickly as possible.

Many thanks beforehand,
Johan

>There was a good series of articles on high-end graphics boards in the
>March and April 1994 Current Notes magazines. Here is a very brief summary
>of the author's conclusions:
>
>NOVA, by Lexicor - by their own admission, it only works on 50% of TTs out
>there. They are not particularly cool if yours is not one of them (no
>refund). Author was not at all please at this, and raged on the company
>bigtime. Amusing reading, by the way.

Mickey,

The Review had a lot of mistakes and errors. There are several
NOVA Users out there who run the NOVA and are very pleased with it, please
check STInformer or STComputer in Germany for a more just review of the
Graphics Board.

The response towards 50% is NOT by admission of Lexicor, this is a
blatant lie, we also offer refunds and have refunded NOVA Graphics Boards
if it cannot get to work so that statement was also wrong from the author
of the Review.

The reviewers board by the way runs fine on another customers
machine, if you read the Review you will find that the reviewer damaged had
admitted to damaging the board, then after damaging requested a refund.

Lexicor's policy does not refund damaged hardware by the User.

You can contact in America STInformer for a review at
1-800-800 2563 for Orders or adderss is:

909 NW Starlite Place
Grants Pass, OR 97526
Support (503) 476-0071

The Graphics Board NOVA has several thousand happy customers around the globe,
and there have only been positive reviews other than Current Notes, which
was not a fair Review for several reasons (some stated above).

If you like to have more information on fthe board I will be happy to send you details on it...

Cheers

Yat @ Lexicor

ps: NOVA is a 24bit Color Graphics Board, there are also SuperNOVA and NOVA VME Plus versions...

I also know LOTS of people who have 9-bit SIMMs in their STEs
without any modification. This is the FIRST TIME I've ever
even seen a SUGGESTION to do so! Mac users also have no
problems using 9-bit SIMMs.

3832. Mono to Color Icons question

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 08:58:35 UTC
From: fnjah@aurora.alaska.edu
Message-ID: <1994Jun2.005835.1@aurora.alaska.edu>
Source record: 186161

ICDRAW is, as everyone has been saying, open of the best Falcon icon editors so far, but I have a ton of mono icons and would like to use them as templates to fill in with color. ICDRAW doesn't seem to be able to load the old .RSC files. Is this true, or am I doing something wrong? Is there any way to convert the old .RSC files into extended resource or .ICO type or something?

>Is that a version that will load the gem.sys AES?

Any version of MiNT (> 1.0, I guess) will load gem.sys if you set it to in
the mint.cnf file. There's nothing special there, the MiNT kernel is pretty
much the same whether or not you package "MultiTOS" or really Multi-AES
around it.

(re: another article in this thread - I never had much luck running 1.09
either, my sources got corrupted somehow. 1.10 made a huge difference, as
far as stability goes. 1.11 will be even better yet.)

>something like graphic draw, or windows, menues,.. and if the os isn't close enough to
>any others like UNIX, why should I start to hang around it in the first place.

MacMiNT was developed because there was no other cheap/free way to get free
Unix tools (mainly GNU software) running on a Mac. In particular, for a hacker
looking for a development environment, it provides a cheap entry that leverages
all the work us fanatical Atari-hackers have put into porting Unix software to
MiNT. If you like Unix, or if you want to play with C programming but don't
want to shell out the bucks for MPW or whatever other commercial development
system on the Mac, then MacMiNT is a decent alternative. If you're not a
programmer and don't care about having a Unix programming environment, then I
don't think MacMiNT gives you anything.

My general observation is that trying to say "Mac user" and "Unix" in the same
sentence is usually pretty ludicrous, but who knows...

The saved games are crypted, I never bothered to decode them. It was easier
to use Ultradisk and SwitchBack to edit the characters after they were loaded
into memory. [Someone once told me it was possible to kill Lord Chaos, so I
took my party of characters, bumped all their stats to max, and sat around
for a couple hours trying to do that. Never happened. Oh well. Even with
characters regenerating mana faster than they could lob level 6 bolts...]

> Oh yes and does anyone know where to FTP "WALLS OF ILLUSION" ??

Holland Game Design proudly presents itself and their first sharewhare release: UFO WAR (c) 1994.

We're a game designing company, working on board games, book case games aswell as software. Our address is:

Holland Game Design
's Gravelandseweg 127
1217 ER, Hilversum,
The Netherlands.

email: Joost.vanderleij@phil.ruu.nl

Our first shareware game is a 2 player game written for the Falcon030, in which each player controls a UFO, and must destroy the other. It's Falcon030 only (256 colours, 768-240 screen mode, DSP mod music). I uploaded it today to ftp.uni-kl.de, but as it is my first upload, a few things could have gone wrong. If you want please email us, and we'll send you a uuencoded version. At the moment I am unable to reach the a.a.u.e. site, but permission is given to place a copy of the game here as well. I'll also try it in the future. Further more permission is given for the ftp.cs.ruu.nl site. All other please refer to text file included with the game.

I hope you enjoy it, and please do send your comments etc.

Joost.

Computers: Atari 2600, 800 XL, Mega STE, Falcon, Lynx and Jaguar.

Mail to: Joost.vanderleij@phil.ruu.nl

Yes, but you edited out an important part of my posting. IT WORKS WITH
OTHER SOFTWARE! (eg Gemar, but there are good reasons why I would prefer
to use DB3 than Gemar, if we can get it working).

HiSoft just sent me v3.02; at least this version doesn't hang when trying
to load the tape. It Bus Errors instead. (This is with all AUTOs and
ACCs disabled, just to be safe).

: both 50hz and 60hz. On my other Sony TV, there's no adjustment at all, so I'm
: pretty much stuck to using an SC1224, or using my Multiscan monitor with the
: SC1224 video adapter block...
^^^^^^^^^^^^^^^^^^^^^^^^^^^^

What exactly does the SC1224 video adapter block do to the RGB signals from
the Falcon. Is it performing a conversion of the analogue RGB signal from
15.75kHz per scan line to 31kHz?. If so where can I get one in the UK.

From: king@tintin
Message-ID: <2skf74$odd@snlsu1>
Source record: 186181

As far as my 2 cents goes, I have used it Calligrapher for quite a while in both English and French. Lots of features, handles imported graphics pretty well, creates quality output. Pretty slow printing (I'm using a HP Deskjet, but the printing is much slower than TeX .) Not to debate or flame,but stuff like Microsoft Word and Lotus AmiPro cannot really be compared to what exists for Atari. I use it at home and for the money it performs admirably well. I cannot give comparisons with other Atari wp's but the multi-language and number of features have satisfied me.

> Any comments welcome

I bought a copy of Calligrapher Junior three years ago. Since then I have upgraded to Calligrapher Professional and then onto Gold. It is very versatile, allowing the me to write books, reports, letters, leaflets, etc.

The only disadvantages are speed and fonts. It can sometimes be slightly slow on an 8 MHz ST, however it is still very usable. Professional and Gold come supplied with 5 fonts. To add new fonts you have to buy them from the company which is not cheap.

The moans aside Calligrapher is a very nice package. Most useful options I find are: spell checker, thesaurus, indexer, flextext and grammer checker. The package also supports RTF export and import. This is useful it you need to transfer documents between the ST and the PC.

I want some pop-up menus in my programs (for my Falcon).

Are there any resource file editors that allow
pop-up menus to be created ?

I could program the objects myself I suppose, but I'm too lazy!

(Hierachical menus would be nice too)

I'm using WERCS at the mo, as supplied with Lattice C v5.6,
but sadly it doesn't cope with these Falcon fetures.

AFAIK there are/were some problems with the gateway Internet <-> MausNet. Maybe some mails have gone lost.

Except that - if I remember correctly - his email address changed some months ago. Since I haven't got his email address right here at the university I'll look for it at home and then post it in here.

3855. Falcon/TT owners unite!

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 12:45:27 UTC
From: whern@bnr.ca
Message-ID: <1994Jun2.124527.26116@bnr.ca>
Source record: 186185

Attention Falcon/TT owners!

Do you find it difficult to get support for your machine? Do you have no fellow owners to talk to and swap hints and information? If so then Falcon FacTT-File is the answer!

Falcon FacTT-File has been set up to help isolated Falcon/TT owners get the help and support they need for their machine. FFF is a database of Falcon/TT users, listing their machine configurations and interests. Subscribers can look for owners with similar machine setups or interests and then contact them to swap advice.

Registration with the FFF is free. Owners send in the completed application form along with a blank disk and a stamped addressed envelope. The disk will then be sent back to them containing the latest version of the FFF database along with as much Falcon/TT PD software as space permits. The disk also contains a mini-magazine which has sections for hints and tips and classified advertising.

Copies of the application form can be obtained by writing to the FFF at

11 Pound Meadow,
The Green,
Whitchurch,
Hants. RG28 7LG,
ENGLAND

and enclosing a stamped addressed envelope. Users living outside the United Kingdom should send an international reply coupon instead of stamps.

The FFF has been running since December of 1993 and has attracted a wide range of users so far. Users have registered from as far afield as Norway and Singapore.

FFF is a non-profit organisation. There is no charge for registration so it is important to remember to include stamp addressed envelopes when requesting either an application form or a copy of the database. Only FFF members will be given copies of the database - no commercial companies will be allowed access, nor will PD libraries be able to distribute it.

Falcon FacTT-File is a great way to make contact with other Falcon/TT users. At the very least, you'll get a disk of great PD software.

I wish more people (like, everyone) would buy a copy of NVDI. It's the fastest, it's the best, it's the most compatible - it's the most essential program for any Atari computer. At least, if you do anything other than play games or run FZT or Protext.

|> It is meant to separate the news of new releases with the discussion
|> followup in comp.sys.atari.st.

Agreed. Check c.s.amiga.announce. It mainly contains news about PD programs,
and I think that it's a Good Thing, as such programs are rarely reviewed in
magazines, so you usually don't know about them (there are less reviews of PD
programs than reviews of commercial ones, even though there are more PD
products).
In recent troubled times (for the Amiga) c.s.amiga.announce was also a place
for companies to show their support (or lack of :( ) of the Amiga.

3859. Atari Archive /Falcon dir reorganized

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 13:27:00 UTC
From: molin@cxc1.cl.msu.edu
Message-ID: <2skmn4$jdn@cxc1.cl.msu.edu>
Source record: 186184

I spent some time last night reorganizing the atari/Falcon directory at atari.archive. It should make things easier to find as more and more files appear in the future. I simply created a series of subdirectories based on the Atari Archive's root directory, and moved the files to their appropriate place within that new structure.

I doubt this bit of knowledge is gonna make a whole lot of difference to most FTPers, however the mirror sites may be interested in knowing of the changes...

So I went to this multimedia show, and what did I see? Tonnes of Macs
doing awesome stuff, a few PCs that looked pretty junky, some SGI
workstations that were very cool, and two Sun workstations...

...and COMMODORE had an _Amiga_ booth!

Any sign of Atari? No; not that I expected it... until the Jaguar has
some "real" things, they won't be at this sort of show... the Jag is
100% games box, and this was a professional-oriented multimedia show.

It depends on which CDROM drive you have. None of the .xfs drivers
worked with my NEC 2Xi, I had to buy ExtenDOS (30 quid, Systems Solutions).

3869. Calamus SL: How does one disable the Calamus file selector?

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 14:46:26 UTC
From: djs@jet.uk
Message-ID: <1994Jun2.144626.29089@jet.uk>
Source record: 186192

Subject line says it all. I can't see any explanation of how to do
this in TFM. Although the Calamus selector may be an improvement on the
TOS one, I want to use my preferred replacement selector with *all* programs.

Sorry, but all of you who did some

```
loop:
move.l (a0)+,(a1)+ n times
dbf loop
```

are mistaken. Did you even try it ? I don't think so. Due to the fact that
the data cache is in write-trhough, each move.l must wait the end of the previous one
before executing. When you've got only one move, the dbf is executed during the memory
write time. Please, test things before spreading errors.

MB.

Ok. I was careful to note that those were the author's conclusions, not
mine (I do not own a graphics board, nor am I shopping for one at this
time). Also, note that I included your company address at the end of the
post, just like the other two cards. This was intended as a "review of a
review", and to point the original poster at some magazine articles.

> You can contact in America STInformer for a review at
> 1-800-800 2563 for Orders or adderss is:
>
> 909 NW Starlite Place
> Grants Pass, OR 97526
> Support (503) 476-0071

Perhaps the original poster will find this useful. Also, if you could give
some references to the other magazine articles concerning the Nova, this
might help the original poster find them.

As an aside: I just called the 1-800 number above, and ST Informer offered
me a trial subscription to evaluate the magazine (which I have never seen,
BTW). Sounds pretty neat! I suggest all stateside STers give them a call
and check it out. I can also recommend Current Notes (possibly inaccurate
graphics card reviews notwithstanding <grin>).

I believe the instructions for that 38400 mod are on atari.archive in
Utilities/Tosfixes/38400.lzh. There are several such mods out there, and
they have different capabilities (and difficulties of installation).

3878. Let 'em Fly II

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 17:16:00 UTC
From: st4w1@rosie.uh.edu
Message-ID: <2JUN199412161423@rosie.uh.edu>
Source record: 186131

Hello world! It's Ken Hollis from Bitgate Software. You may have been wondering what happened to Let 'em Fly for the past year.

Let 'em Fly has been cancelled by Oliver Scheel, for reasons still unknown. Recently, I talked to Oliver Scheel, and he gave me the permission to update the program and release it on a regular basis, so that is EXACTLY what I intend to do.

Right now, Let 'em Fly is under a re-vamping, meaning that it is being completely reprogrammed. Many of the same functions will remain the same, like the flying routines, and the other good routines he's got. Many things will change and it will not only be faster, but it will take up less memory.

One of the major additions will be the inclusion of NKCC in the program as the natural keyboard handler. NKCC is a much more easier-to-follow and easier to understand routine, which offers better keycodes. Talk to Harald Siegmund for more on that.

If any of you out there are very interested in Let 'em Fly, please write to me in E-Mail, NOT posting on this system. If you post, it will be ignored... I have to post from another system.

Please, if you are interested, write to:

khollis@bitsink.gbdata.com.

I would be interested in getting any input you have, or if you have any suggestions on what new can be put in there, PLEASE, let me know.

Let 'em Fly is being developed by myself, Ken Hollis, and Darryl Piper (drpiper@cix.compulink.co.uk).

Let 'em Fly is hereby known as XAES Background. All new updates for Let 'em Fly will be released under the name of XAES-Background. If you are looking for updates, please write to me or Darryl. XAES Background's very first version was released last week.

I have the program, so if you are interested, please write to me and I can UUE it and send it off to you.

Don't delay! Get LTMF-2 today!

-- Ken Hollis

From: erkamp@titan.arc.ab.ca
Message-ID: <Cqs8sC.D89@arc.ab.ca>
Source record: 186118

I have recently started playing with this program/accessory and it's kind of a hoot. The problem I have run into is that I have redefined some of my mouse pointers and one of them uses an animation. I have made an AUTOLOAD.PRG and put it in the AUTO folder. Everything works fine except the animated pointer (replacing the busy bee) moves across the screen until it hits the right hand side and just sits there!? If I load the MKMII.ACC with the autoload program this doesn't happen. Any ideas what is going on? I don't really want to have to load MKMII.ACC all the time and my impression from the documentation is that it's not required. I have quite a few other autoload programs and have also used up all my accessory slots (lucky we have Chameleon). I would like to use this but the way it sits right now it's not acceptable. Note the non-animated pointers work fine.

That's not the point, and why should I waste the time? The point is this:
Why bother CREATING a newsgroup that will get precious little traffic? I
acknowledge the many existing newsgroups that get little or no traffic;
yes, they should be removed (IMO), but I'm not gonna bust my ass over it.
But to CREATE a newsgroup that will be devoid of postings...That's
something else entirely.

This is impossible ! the instruction "move.l (a0)+,(a1)+" is in the instruction cache ! And with your
method, the instruction is never in the cache !!
If you made :

```
loop: rept 64
move.l (a0)+,(a1)+
endr
dbra d0,loop
```

this is faster than :

```
rept (d0+1)*64
move.l (a0)+,(a1)+
endr
```

it's sure !!!

Emmanuel.

3886. Printing through serial port problems

Newsgroup: comp.sys.atari.st
Date: 1994-06-02 19:20:55 UTC
From: bobz@crl.com
Message-ID: <2slben$ktm@crl.crl.com>
Source record: 186125

A few years ago, when I failed to make my ST (TOS 1.4, 2.5 meg) print to an HP Deskjet 500, I concluded that I was stupid or that it needs a special serial cable. I live happily using the centronics parrallel interface.

Now a buddy calls needing advice about connecting his STe to an apple laserwriter using the serial line. He's purchased a cable with RS232 on one end and the RS244 (I hope I got that right) on the other. The cable was intended for a dos box, but should be the same don't you think ?

Checking the Abacus "Internals" book for pin-outs I discover a line of text that suggests that printing will not be possible due to a bug in the rts/cts routines. Unfortunately both my buddy and I have tried every rts/cts "fix" program and still have NO RESULTS.

eg from gulam we say :

cp testfile.txt prn:

nothing happens.

From pagestream (configured to print to the serial port) nothing happens. No blinking, no gibberish, no motor activity ... nothing whatsoever is happening on the printers.

What have we missed?

thanks,
bob zawalski bobz@crl.com

Is "Interface" PD/shareware? If it is, where is it available, if not- how much does it cost,
and who makes it?

Opps, I made an obvious error in my last posting which I do not
regularly make trying to print using a serial connection.

I said:

>eg from gulam we say :

>cp testfile.txt prn:
^^^
what I do say of course is: cp testfile.txt aux:

I forgot to mention thatI have set baudrates to match as well.

Thanks for any assistance.

3897. Private FTP uploads possible?

Newsgroup: comp.sys.atari.st
Date: 1994-06-03 00:11:04 UTC
From: hallvart@ifi.uio.no
Message-ID: <2slseo$drn@solva.ifi.uio.no>
Source record: 186126

I was wondering if it would be possible to use certain FTP sites for transferring binary files to a friend of mine?
The situation is this:
My friend has an ST, and so do I, and we both have samplers (though different types), and found a program that can be used via the ST to take both standards, via MIDI dump.
I usually UUencode/decode small binary files, but samples can be pretty long, so email might not work, so- would it be possible to use an FTP site to simply upload files, then download them again, shortly, by the other person?

I remember getting a file from someone this way- he gave me a password that I had to write when decompressing the file.

3898. Util to copy directory trees from ST to Unix

Newsgroup: comp.sys.atari.st
Date: 1994-06-03 00:44:21 UTC
From: bobz@crl.com
Message-ID: <2slud5$lr7@crl.crl.com>
Source record: 186127

I have on atari HD many megs of client files arranged as follows:
j:\client1\
j:\client1\ldw\
j:\client1\ldw\files*
j:\client1\pgstrm\
j:\client1\pgstrm\files*
j:\client2\
j:\client2\ldw\
j:\client2\ldw\files*
j:\client2\pgstrm\
j:\client2\pgstrm\files*
j:\client3\
j:\client3\ldw\
j:\client3\ldw\files*
j:\client3\pgstrm\
j:\client3\pgstrm\files*
etc.

To back these up, I've written a wrapper for lharc (quester) which creates client1.lzh client2.lzh etc. which contains all of the files, (or if I specify arguments - only files which match the file-mask).

This takes a very long time (severly impairing pgstream or ldw if run in the background under MiNT).

This done, I've used rz to put it onto my sun filesystem for archiving.

I'd prefer to archive (tar) and compress (gzip) on the sun and only send the directory tree to the sun. I'd like to do this without creating temporary files on the ST's filesystem, but rather to just copy them (recursively) to aux: and then have a process such as: tar cf backup.tar - running on the sun archive them.

A way to redirect the output of tar.ttp to aux: is all that I need. An experiment: tar.ttp cf - testdir*.* which was captured into a FLASH telecom buffer which was then "uploaded ascii" seemed to start to work. If I could redirect tar's output to the aux: I'm sure this would do.

What do others do to transfer megs of stuff from ST to unix?

thanks,
bob zawalski bobz@crl.com

Announce groups generally have very little traffic. The point of creating
one is to be able to, er, announce things. That is, announcments of stuff
that are presumed to be of interest to many will not be buried in the
general news articles of the other groups. I have a bunch of announce groups
at the head of my newsgroup list, and there are probably 10 posts a month
to them _combined_. However, they are 10 posts that I definitely want to read.

Another way to look at it is: Why not? If it provides even a small amount of
convenience, I say go for it (in fact, I did say go for it).

If this group becomes sufficiently widespread (some groups don't seem to
make it to some sites, even comp.* ones), I am considering having the
"weekly new stuff" postings from atari.archive.umich.edu routed there.
IMHO, this would be an ideal application for such a group. Any comments?

Boy, looks like another innoculous statement made by yours truly has started a barrage of "you hate Atari" posts. Thanks (for nothing) to the dozen or so people who left me hate mail about this topic. You guys REALLY have to lighten up and get lives, y'know?

But anyway...I want to make something crystal clear. I'm not enthusiastic about a comp.sys.atari.announce group for the reasons I'd already stated. Someone asked for comments, I gave it. Period. Any more questions will be deviated to dev/null, thankyouverymuch.

(And Mikey...This message isn't tended to be a barbarous attack on you, so please don't take it that way.)

You have just described the very nature of nearly every comp*announce news-
group. The idea is just that, to help manage and to make the news that is
not discussed in this comp*announce.

Not everyone get's to read comp.sys.atari.st at a daily basis, some read it
weekly..some just don't, because of the volume of posts. I know there are
newsgroups with 100 times more posts/drivel etc. however, that isn't the
point.

People who are more busy, or who just don't spend so much time on the net can
read the announcements group BECAUSE there is so little of it. It focuses
as well, then if they want to discuss it, they can always know whereand
what to search for in comp.sys.atari.st

I mean, all I have to do is not read this newsgroup for 1 month and I could
never catch up (not like I read all the posts anyways..that is close to
impossible anyhow given time etc.).

I think this would be a good idea to post the weekly new stuff in announce,
afterall it is announce nature ^_^

Cheers

3903. Help needed:converting "Fastbase" files to "Adresse 1.8"

Newsgroup: comp.sys.atari.st
Date: 1994-06-03 03:35:54 UTC
From: hallvart@ifi.uio.no
Message-ID: <2sm8eq$foh@solva.ifi.uio.no>
Source record: 186007

I've gotten hold of the excellent address database "adresse 1.8" by
Carsten Setje Eilers (Germany).
I've previously used "Fastbase", and have all my addresses there, but
want to export them into "adresse".
The "export" function of "Fastbase" works fine- it makes a file with a .CSV
ending after, but the problem arrives when I try to re-load the data into
"adresse". I have tried all sorts of combinations with the formats, but
my addresses seem to be spread all over. I don't really feel like typing
in all of my addresses into "adresse" again, when I have them in "fastbase", and
as all the documentations for "adresse" is in German I don't understand much (the
program itself however has an English resource file).
Can anybody help me with this? I have the format listed, I just need to know how to
set it up.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
---
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX .....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].

- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Yes... The purpose of DRDOS is to mimic MSDOS as close as possible,
however, and presumably add some extra bits. Whereas SMS2 is (or so
we're told) supposed to be able, in time, to do quite a bit more than
QDOS.

(Compare SMS2 with SMSQ, which is a re-implementation of QDOS from
scratch which is supposed to be as close to QDOS as possible.)

>don't have the money for another monitor. I paid quite a bit for my SVGA
>Multisync.

Uhm, you CAN get a 50hz TV in the US, you just have to know where to look.
If you have a SVGA Multisync, and it does 15.8khz, make yourself a cable!
They're a doddle to make, cost you max US$15 for parts, and you can then use
TV/RGB modes as well...

Otherwise you have a problem boy ... ;^)

Karl.

```
==========================================================================
I'm not talking about any great feature of the system. I'm just talking
about how it works and has worked. Some what a pain, but easy to get around
and live with.
==========================================================================

Sorry, Dan, but you don't know what you are talking about. You are making
invalid assumptions about how the video system works.

When a demo uses vblank for timing video/animation then it will be independant
of the screen refresh rate. The demos that cause the screen to flip
set the video mode directly to 50Hz, and your TV/monitor probably can't
handle it - OR it doesn't use vblank. If a demo were trully hardcoded for
50Hz and didn't use the Vblank, it would use some other MFP timer or
I think there is a 50Hz clock independant of vblank (I seem to remember it
being talked about, but I can't find any hardware locations, but you could
make one using the MFP divide-by counters. If this was done, =AND= the
demo did not set itself to 50Hz, then to get the display timing and the
video in sync you would need to run a program to set the video mode.

However, this rare case will cause flicker, NOT vertical scrolling of the
display. I believe there is a "patch" for programs that set the screen to
50Hz that works be polling the location until it is 50Hz and then sets it
back to 60Hz and stops polling. This will let most 50Hz demos run on
a 60Hz TV or Monitor.

In =NO= case, whatsoever, can you "send" data to the video system. The
video system will not "accept" data at all. The only thing you can do is
change from 50 to 60Hz, and change the screen pointer since the video
system uses DMA access to screen memory. You write to the screen, and the
video hardware reads it later. You can't EVER get a scrolling screen from
improper programming - that is purely from the display being unable to
sync to the video hardware output. Changing to 50Hz first won't fix this
problem.

Another possibility that may look like th weird screen flipping, is to
count hblanks, since there are fewer hblanks in NTSC than PAL you can get some
timing problems, but I doubt it would EVER look like screen flipping.
There are lots of possibilities, but you simply have to try real hard
to hard-code a demo for 50Hz. It may switch into 50Hz and make your TV
flip around, but other than that, there is no "sending data @ 50Hz"

```
==========================================================================
It's not the modem you should be worrying about; it's the computer. The
problem is that computers earlier than the TT have a serial chip that can't
handle higher than 19200 bps for async.
==========================================================================

Actually it can, but not without additional hardware. You can also turn
off the divide by 16 clock in software, but I think you need at least an
STe or else you are put into synchronoius mode when this happens. Generally,
you should use a TT since the interrupts @ 38400 and higher happen too
frequently for an 8Mhz ST (with all the other stuff the ST must service).

>; Instruction cache on
>; Data cache off
>
>loop: move.l (a0)+,(a1)+
> dbra d0,loop

Isn't this actually faster:

loop: move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
dbra d0,loop

Or am I totally wrong here???

Doesn't the dbra take any time?? In that case your version is faster,
but...

: faster, (a0)+,(a1)+ or -(a0),-(a1)?

No, that's not the max, but you do want to maintain some control over how much you want to copy.

And I don't think either one is any faster on the 68030, but it doesn't matter, because you'll be forced to use one or the other if the source and destination blocks overlap.

3914. Re: Demos for Falcon

: This is impossible ! the instruction "move.l (a0)+,(a1)+" is in the instruction cache !
And with your
: method, the instruction is never in the cache !!
: If you made :

: loop: rept 64
: move.l (a0)+,(a1)+
: endr
: dbra d0,loop

: this is faster than :

: rept (d0+1)*64
: move.l (a0)+,(a1)+
: endr

: it's sure !!!

: Emmanuel.

You should have paid attention to the thread. If you COMPLETELY unroll the
loop, then you're wasting time and memory. But PARTIALLY unrolling the loop
makes significant speed increases.

<Very nice list of ftp sites deleted>

>DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
>--------------------------------
>1) Go to the directory where you want the files to be downloaded.
>2) ftp [CR].

< 3-13 deleted.

All of the work described in points 3 to 13 (and the "bin" transfer
mode instructions) are radically simplified if one uses the "getit"
and "lsit" utilities. "lsit" allows you to retrieve a listing of any
directory accessible at an ftp site by typing:

lsit machine.site.domain:dir/subdir

where you'd substitute (for example) "atari.archive.umich.edu" for
"machine.site.domain" and "pub/Newitems" for "dir/subdir" .

You can browse this file at your liesure and then if you wanted to get
(for example) "tcpip.faq" from this directory you'd type:

getit atari.archive.umich.edu:pub/Newitems/tcpip.faq >/dev/null &

and do something else while the file is transfered speedily. I
apologize if the path pub/Newitems is incorrect. I've aliased this
all away some time ago to getumichnew .

The getit logs you in (anonymous : you@site) sets binary transfer,
cd's to the right place, "get"s your file and "quits" reliably and
speedily. Using it for over a year now, I compare the interactive mode
of cd_dir_get to typing modem AT commands by hand :-(

These programs are not confused by instructions in .netrc files so you
don't have to loose "tailored" interactive ftp-ing to use "getit".

lsit and getit are freely available and can be found in several ftp
sites using archie.

Hmm. It only runs in stock Atari 16 colour modes (ie if you have a graphics card, it won't work at all, and if you are running > 16 colours it won't work either). The interface is also extremely idiosyncratic ('daft' :-) But it sort of works (despite those limitations) and you can, in fact, edit the MTOS icons.

There are countless ST ports of the character based game. The best IMHO by miles
is the GEM graphical port. This really needs a high res system like a TT or
Falcon though.

|> Is this game PD/Sharware, if so, where could I get it (NO FTP, I don't have FTP-acces),
or
|> could somebody be so kind to E-mail it to me.
It's pretty big. I'm sure most PD librarys should have it. It's certainly on a
few sites I have seen.

Yes, if you ask Hisoft they will send you a demo disk of Payrus Gold,
which is limited to printing one page only, can't export, and also
(playfully) reverses some letters in the printouts :-)

Unfortunately, the demo cannot be given away (uploaded etc) according
to the readme file on the disk.

It really is a wonderful program, btw. I can't wait for the full
English version to be released (it is getting a spell checker,
according to Dave from Hisoft).

It does all that is possible - the reponsibility for creating popup
and hierarchical menus is down to the programmer, see the
documentation on menu_attach() and menu_popup() (they're called
something like that, at any rate)

3927. Ishido,wanna test it?

Newsgroup: comp.sys.atari.st
Date: 1994-06-03 09:26:54 UTC
From: mdekker@fwi.uva.nl
Message-ID: <2smt0u$hl@turing.fwi.uva.nl>
Source record: 186147

Hi,

After some delay we now finally have a test version ready of the ancient
puzzle board game 'Ishido' (maybe some of you have seen this on the lynx).
We have programmed it on a 1040STfm, TOS1.4. We would like to test this program
on a falcon and/or TT but we have no access to such a machine. Therefore we
ask you guys. Are there any falcon/TT users out there willing to test this
program? We already have some people owning ST's and STe's that will test
this is program. People testing this version will become automatically
registered users and will get the complete package (to be finished soon). This
test version is a test version of the demo-version that will become freeware
as soon as all the bugs are removed.

If you want to become a tester, please send me some E-mail (do not forget
to tell me what system you use)

Enjoy!

3928. ST-NEWS DISKS

Newsgroup: comp.sys.atari.st
Date: 1994-06-03 10:35:32 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2sn11k$m8@golem.wcc.govt.nz>
Source record: 186053

Hi,

ST-NEWS disks 4.2-4.4 have problems on a 4 meg STE,
they come up with a dialog box stating you must write protect
your disks...

Is there any fix/patch for this, as you can't run the program otherwise....

Some of the more popular samplers (Ensoniq, Roland Yamaha) have their own mailing lists & sample sites. Maybe you could use these?

What is the program you found, & where was it (I have an Akai S900 which can do SDS dumps)?

: Oh yes and does anyone know where to FTP "WALLS OF ILLUSION" ??
: This looks *Exactly* like Dungeon Master and is PD !!

I have the English version that was on this month's ST User cover disk.
I'll attempt to upload it to a.a today. In the meantime, I've put a
copy on aire.ncl.ac.uk:/pub/misc/woi.lzh. In the docs, it mentions
ST/TT/Falcon compatability, but it doesn't run on my TT. As this
appears to be a cracked version (why crack a PD program?), I assume
that some wombat has added some 68000 only assembler or something
equally stupid (guess who's not impressed). If anyone knows where to
get the original (i.e. runs on a TT) version, I'd love to know.

Just a thought.
There is a bit in $ff8260 where you can make the shifter sync on a
external sync input. With no external sync input the shifter will not
start displaying a screen thus the shifter will not acces the memory.
I don't know if this will speed up processing but it is worth a try.
Warning. I don't know if your monitor likes this since it doesn't get
a proper signal.

> makes significant speed increases.

This is WRONG!
Because in this example:

loop: move.l (a0)+,(a1)+
dbra d0,loop

the "dbra d0,loop" instruction will take 0 (zero) cycles to execute.

I did some timings (again) yesterday and "move.l (a0)+,(a1)+" is faster than
"move.l -(a0),-(a1)". Also, there is NO speed increase if you do:

loop: move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
move.l (A0)+,(A1)+
dbra d0,loop

instead of doing:

loop: move.l (a0)+,(a1)+
dbra d0,loop

Hmm, dunno if the memory is a problem, or if the system is (I'd imagine
it's the memory, as I'd hope they'd make STE-compatible stuff).
On this note, maybe you should try making the system think it has less
memory (using a program like MAKE512 or MAKE1024, one or both I think
are on atari.archive). If it's one of those programs that can't handle
4 megs ram, then this may help. Lemme know if it does...

How about asking your sysadmin for a directory on their anonymous ftp site?
If they don't have one, they are easy to set up. The answer might be no
for a number of security reasons, but it is at least worth a shot.

>
>How do I read a text file that has been encoded in BASE 64..???

The base64 encoding is part of the MIME standard. MIME is the
Internet standard for encoding binary files in mail messages and news
articles. It is specified in RFC 1521.

A simple MIME encoder and decoder is mpack, which is on
ftp.andrew.cmu.edu in /pub/mpack. Unfortunately, although there are
Amiga, Mac, PC and UNIX versions, it looks as though nobody has got
around to compiling an Atari version. Perhaps someone could fetch the
sources and have a go?

An even simpler encoder/decoder is encdec.c -- use archie to find it.

Make no mistake, Atari users: you *will* need these programs. Just as
JPEG practically killed off GIF, MIME is killing off uuencode.

Yes - you can mod the old die hard ST to handle 1.44 disk as well (or
you can buy a module).

I have an archive with some info on this and a number of people are
asking for it, so I'll upload it to a.a.u.e this weekend - watch out for
a post.

Cheers

>
> Thanks
>

Mosaic for the ST? hmm... 1st, you need a lot of memory--Mosaic saves alot of data in its "path" buffers to let you go back to previous menu's, etc. 2nd, you need a big screen. When I run Mosaic, its window is usually as tall as the root window on a 1024x960 screen, maybe half the width. I run it on a Sun SPARC machine, but sometimes I move to an IBM RT with a small mono screen, and it's pretty lame on that screen. 3rd, the machine needs to be fast! I did speed comparison tests between the standard 8mhz ST and some of these machines,
and for example, the SPARC is around 22 times faster than the ST, and Mosaic is not bliding fast on the Sun. Of course the ST implementation would be different... it would probably use GEM, and a lot of simplification, but , I don't think they could compensate with software for so much lack of processing
power. I can see it running on a falcon or a TT though... 4th, Mosaic needs a
fast network!!! (probably biggest problem). Unless you're connected by ethernet,
forget it... a lot of the WWW sites use graphics! a lot of it too. the net has to be able to transfer these things quickly, otherwise it gets boring. it's
an information browser, and if you have to wait half an hour to see the next screen because you're doing it over a 9600 bd slip connection, it's not worth it.
we have a fiber optic net here with average rates of 200K/s and I still think it's slow. Yea, for those ST users who have a TT on the net, it would be cool,
but, for others... ummm... let's face it guys... the ST has its limitations.

I was working in computer lab last semester, and some people needed to use mosaic for one of their classes, so I suggested that I would compile it on some VAXstation 2000's, ... needless to say, my boss and the other computer geeks that were listening to the conversation were almost ready to throw me out of school for such an outrageous suggestion.

>TOS one, I want to use my preferred replacement selector with *all* programs.

There is an option in a dialogue box somewhere that lets you do this. You
click on a button market TOS for the standard (or replacement) file selector.

I can't remember exactly where this is (I can't use my copy of SL until my
******* hard drive eventually comes...).

Try the preferences dialogues in the menus, or miscellaneous settings or
something.
Try the System Parameters module too.

I have a look tonight and post, OK?

Atari hardware and software for sale. I think these prices are reasonable,
but if you don't, make me an offer. Willing to discount a package price.
Shipping not included. $700 takes all.

W. Grant Grovenburg
(wgg@col.hp.com)

Atari hardware stuff:

$125 - Atari 520 STe with 2.5 mg RAM

$75 - Atari SM124 Black & white monitor (1991)

$25 - Taxan Color monitor

$90 - Atari 520 STfm with 1 mg RAM
(The printer port is intermittent. I'll fix it for another $10)

$70 - Atari SM124 Black & white monitor (1987)

$5 - Atari Joystick

$10 - Monitor Master

$65 - Future Sys Inc. GTS100 DS-SD 3.5" floppy drive
(The power connector is intermittent. I'll fix it for another $10)

Software:

$125 - Cubase 2.0
(can upgrade to 3.1, which retails for $463, through Steinberg for $120)

$25 - Electronic Courseware Systems Midi-Musicware Series: Keyboard Chords
(by G.D. Peters) (orginally $64)

$20 - Keyboard Intervals(by G.D. Peters)

$15 - 1st Word Plus
$10 - Quick ST II + Quick Tools v.1
$5 - NEOchrome
$2 - Compute! - Atari ST disk 6/87 Vol 2 n3
$2 - Start
$5 - Aerco easieST RAM Utilities Ver 1.0

$45 - Laser C + Laser DB

$5 - Mean 18
$5 - Dungeon Master

$8 - Triad: Defender of the Crown, Barbarian, Starglider
$3 - Marble Madness
$5 - Hitchhiker's Guide to the Galaxy

$5 - Magical Math 1
$5 - Spelling Bee
$5 - 1st Math (Stone & Assoc.)
$5 - My Letters & Numbers (Stone & Assoc.)

Books:
$3 - Atari ST Basic
$3 - Atari St Basic to C
$3 - Atari ST Graphics & Sound
$3 - Intro to Midi

MONDO BIG SALE! OVER 450 TITLES!
==========

All these used ST titles are for sale, everything is going. Most are only one piece items, so it's a first come first serve situation. All prices are NEGOTIABLE, and the highest price takes the item (no matter what the price, like it says, everything is being sold). Please notice the stress on the word negotiable.

Everything is in good condition and works, please send e-mail if interested. I also have a bunch of PD disks (I can send an uu encoded file with a catalog there are about 1200 disks) for $1.49 each.

And if you are looking for PC (Dos or Windows), Macintosh, Apple II, Amiga, Commodore 64/128 or other tiles, please e-mail to get a list of those items.

Title	Maker	Price
1943	Capcom	$5.00
3D Fonts II	Antic	$5.00
3D Glasses	StereoTek	$99.00
5 Star	Ocean	$8.00

I have a Mega 2 St with TOS 2.06 installed and the animations don't work
correctly unless the accessory is installed. I have other things running that
may be causing the problem (Warp 9 comes to mind). I would really like to use
this more but until I get Geneva I am out of accessory slots.

I don't care about YOUR logic of the situation when the hard experiemental results show differently. I copied the same 128k block 20 times to different places in memory, and I timed it using the 200hz system timer. The unrolled loop showed to be appreciably faster.

Fortune V1.1 for the ATARI Falcon

The version 1.1 of the Fortune program is now available at
archive.umich.edu in the atari/falcon directory.

Fortune is a program that tells you a fortune whenever you boot your
Falcon. Like on big Unix machines statements of well know persons
will be shown on the screen. But you will also actually hear them!

You will hear Captain James T. Kirk, the Terminator, Monty Python and
a lot of other stars in the unique sound quality of the falcon.

You can produce your own fortunes using the harddisk recording program
WinRec to record the sample and then editing the sample with Fortune.

Another very interesting feature of Fortune is its capability to import,
export and convert many different sound formats. You can use:

- DVSM (used by WinRec)
- AVR (used by many ST/TT/Falcon programs)
- AU,SND (used on SUN, NeXT)
- WAV (used on PC's)
- Raw (for many other cases)

Fortunes comes in an English and German version with about 10MB of
new sound-fortunes (samples).

>

MTOS is much nicer with NVDI than without because everything gets drawn on
the screen much faster. This becomes very important when you star using
MTOS in higher bitplane modes and/or higher resolutions with
BlowUp030/Screenblaster.
If one does not have NVDI then one cannot speed-up graphics operations
under MTOS can one?
That is what NVDI does. Where did you get the idea that I though NVDI
speeds up MTOS? It speeds things up only in the sense that you do not have
to wait as long for your windows to be drawn or text to be printed.(just
like Warp 9 except Warp9 will not run under MTOS!)

>I want some pop-up menus in my programs (for my Falcon).
>
>Are there any resource file editors that allow
> pop-up menus to be created ?
The popup menus are not extra objects in the resource file, they are
just trees which are attached to the menu tree. If you RTFM you will
find a AES functions called menu_attach & menu_istart. You use these to
connect the submenus to the main menu.

>I could program the objects myself I suppose, but I'm too lazy!
See above.

>(Hierachical menus would be nice too)
These are just submenus attached to submenus.

>I'm using WERCS at the mo, as supplied with Lattice C v5.6,
> but sadly it doesn't cope with these Falcon fetures.
The only thing that WERCS doesn't handle is the G_CICON object.

BTW, I have just finished a library which will allow the older AES' to
have drop down submenus just like the Falcon. It only has two
functions:- menu_attach & menu_istart. :-) Anyone interested?

>something like that, at any rate)

To be quite honest, I just wrote my own popup menu routines. If you use the menu_attach() & menu_popup() functions, you're limiting your user base (e.g. your program won't be able to run on a ST). Now if you're creating something that requires other features that aren't available on eariler machines (like 16 & 256 color modes), then this isn't an issue.

However, if you are trying to create something that will be used on all machines, I suggest writing to code yourself.

In a message dated 6-3-94, Timothy Miller said:

"My monitor does not do 15.75khz. They don't make monitors
like that any more.

Actually, they do, but they are rare. Idek makes a 17" model than can go as low as 15.75Khz, but even at a mailorder discounter, it cost just a bit under $1000. Also, Electrohome manufactures and sells one (a 15" model, as recall) for about $499...currently the least expensive new one I know of, since the Commodore 1942 became unavailable. There is a big GVM-series Sony multisync that is still manufactured, that will even accept composite (like the old Mitsibushi Diamondscan's, such as the AU-1381), but it makes the Idek look inexpensive.

"Check on a Cmos data book, all unused inputs must be
connected to 0v or +v, if they are not, the device can draw
large amounts of current and the device will get hot, and
damage its self...."

Hmmm...I thought I rememberd something about CMOS chips consuming more
power if inputs were left floating. I assumed since I had not heard of STe's
burning up right and left this meant Atari had simply grounded the unused
SIMM pins.

I suppose given the price of SIMMs at the time the STe was introduced,
they thought "Who would ever use a 9-bit SIMM instead of an 8-bit one...they
cost more", and thus did not make a simple addition to the PCB traces.
Typical Atari "forward" thinking! <grin>

Luckily, it appears the extra power consumption is not a severe problem.
The next time I am inside my STe, I may look into grounding those unused
inputs and see if it has an easily detectable affect on the heat output
from the machine.

I wonder if the people that designed the memory/HD chassis took this into
consideration in their design (the one for my A500, that is).

3976. Value of BlowUP Hard 1

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 03:02:21 UTC
From: scotty@cais.cais.com
Message-ID: <2soqrt$snr@sun.cais.com>
Source record: 185959

I tried the demo of BlowUP, and was amazed at what it could do with my Acer 7015 Multiscanning monitor. It let my Falcon change the size of my desktop well beyond 600*800, allowing much more room to work. I could compile C programs and have full-size windows elsewhere on the desktop at the same time! I decided to purchase BlowUP soon after.

The documentation said that if I had a multisync monitor, I should get the "Hard 1" version of the product for greatest versatility. There is also a "Hard 2" version, but they recommend that only for VGA/SVGA style monitors.

I ordered the "Hard 1" version, and found out that it uses a connector that taps the joystick port (next to the mouse) to provide a faster clock rate for the scan frequency -- 50 MHz. The only problem is, I have yet to find a single configuration, using this frequency, that doesn't drive my monitor nuts!

The two standard clock frequencies (available with the software version of BlowUP by itself) are 25 and 33 MHz. Either one provides a variety of useable resolutions for my monitor. However, every single configuration I've attempted that uses 50 MHz causes the display to "wipe out" -- to scroll sideways in a berzerk fashion, sometimes accompanied with a high-pitched whine. Fortunately, you can hit "escape" to return the display to a safe setting when this happens.

Based on the documentation (at least the well-translated parts) it seems that my Acer monitor, which has been widely sold for Atari computers, is a type BlowUP calls MS1: it has a horizontal scanning range of 15 to 36 KHz. BlowUP also refers to MS2 monitors, which have a range of 30 to 50 KHz. I'm starting to believe that since I don't have an MS2 monitor, I'll never get any use from the hardware in this product. If that's the case, I could have easily saved over thirty dollars, and let someone who could use this connector buy it! Why else, in the dozens of preprogrammed configurations, would there be *none* that provide a stable image using the 50 MHz pixel clock?

I note that the documentation recommends using the 16 color modes and below only with the 50 MHz pixel clock, but this has not helped at all. If anyone has had any success using the Hard 1 version with this type of monitor, please let me know what configuration you used. I'd just love for this to be all due to some major oversight I've made*.

Thanks.

Scott R. Chilcote

3978. Atari ST UUCP Connections

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 04:52:40 UTC
From: Steve.Barnes@lchurch.mcd.on.ca
Message-ID: <770715752.0@lchurch.mcd.on>
Source record: 186043

G'day everybody, just thought I'd pop in and say hello and announce that the Logic Church BBS is now plugged into Usenet and this and st.tech. Is st.advocacy up and running yet? I voted for it..

Anyway, onto more important things. I'm using the UUPOLL, UUCP, UUCICO from the mercury utilities and STufit from Steve Caple to convert from *.X *.D files to Jetmail compatible packets. Are their any other software choices? I noticed that it appears that other are doing similar things here.

Next, WRT UUCP - I started out using the mercury version - very slow. I found a newer version (though it still appears to be written in GFA), slightly better. Averages around 800cps. Sort of pathetic for a 'locked' 19.2 connect (v32b). My question is, is their anything better - I'm going to go broke at $2.50 per hour from my host! I do realize that thier is only so much you can do when your acknowledging 64 byte packets but my host reports about 1300 cps from his feed.

If it helps any, this is on a T16'ed TOS 2.06 machine, 2.5 meg.

Also, is thier anyway around the unix case sensitivity? At least a third of my inbound mail gets orphaned because of this.

Thats about it off the top of my head. If you can help at all, please give me a shout. BTW, its very nice to finally get onto something that isn't as noisy as FIDO or AtariNet!

-Steve, steve.barnes@lchurch.mcd.on.ca

3979. Protracker MOD file format

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 05:42:06 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2sp47e$9ar@mailer.fsu.edu>
Source record: 186027
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Would some kind soul post or email me the format for Protracker sound modules,
or point me to an ftp site from which I can ftp it? I'm primarily interested
in where the name of the module and the names of the samples are stored.
Thanks in advance.

3980. HD Virus. HELP!!

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 06:11:25 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <2sp5ud$fp1@infa.central.susx.ac.uk>
Source record: 186019

Hello...

I think (well I'm quite sure) that I have a virus resting on the boot
partition of my hardisk :-(I think it's a 'Goblin Virus' or 'Ghost Virus',
and they are boot viruses which means that I can't cure it with the virus
killers I have (they only allow for link viruses on the HD).
So could anyone help and suggest a program (commercial/PD/Shareware, etc,
I don't care which) that will allow me to cure boot viruses on my HD.

Thanks

Andy

>Uhm, didn't he like retire from duties a few weeks ago!?

Yah, he also just retired from the Mint mailing list a couple days ago; due to lack of net access. In general, when you want to contact us, you should use the advertised aliases, not emailing to a specific person. We all check in at varying hours, so emailing a specific person reduces your chances of getting a timely response.

So everyone, burn these addresses permanently into your brain's EAROM....

atari-archivists@atari.archive.umich.edu
mint-request@terminator.rs.itd.umich.edu

Also, if you are sending a message to the mint mailing list, you don't need to also send it to mint-request, (i.e., don't cc: it) we already get everything sent to the list...

Ah well. I've gone the whole route, starting with Turbo ST, trading it in
on the Quick ST offer, several rounds of updates there, Warp 9, and now I
use NVDI. It was pretty much a requirement since my Warp9 didn't run very
well on the Falcon, and it had no hope of working with ScreenBlaster. So
now I run NVDI 2.5 on all my Ataris, TT, Falcon, STe, Mega, and life is good.
Works with MTOS, works with Cubase, case closed.

3983. Unrolling or not? (Was Re: Demos for Falcon)

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 08:42:50 UTC
From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <2speqa$ric@vishnu.jussieu.fr>
Source record: 186025

I tried personnaly to find the fastest way to clear a 320x200 TC screen. At
the moment, the best I found is a partial unrolling of movem.l dx-ay,-(az), with all the
regs set to 0. I tried nearly everything (one move.l d0,(a0)+, several move.l d0,(a0)+,
the
same with -(a0), and I'm pretty sure that partial unrolling of move.l d0,(a0)+ was slower,
which caused me a shock, I must say it.

To test the speed of a routine, I suggest you the following, it's the easiest
and surest (?) way to do it :
- you install a vbl routine in $70.w, which is like this

```
vbl:
movem.l d0-a6,-(sp)
move #$2700,sr ; disable all ITs ( better for speed tests :o)
<set background color to RED for example>
<my routine to test>
<set background color to black>
movem.l (sp)+,d0-a6
rte
```

and you can see directly on the screen the time taken by your routine. Yet best : if you
want
to compare the speed of 2 routs, just exchange between two vbls each of twos containing
one of the twos routines to test. By setting the background color to blue in one vbl, and ,
say, green in the other, you'll be able to compare visually the speed of both routs.

Another trick : if you REALLY think that your display is interleaved, then
draw all your screen with one line black, one white, one black, and so on... If it WERE
inter-
leaved, you should see a completely flashing screen. You don't. Then try it with
interleaved
modes on the Falcon...

MB.

3984. (a0)+ vs -(a0) (Was Re: Demos for Falcon)

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 08:50:26 UTC
From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <2spf8i$ric@vishnu.jussieu.fr>
Source record: 186026

As someone pointed it some times ago, predecrement mode may be faster
than postincrement because address calculation or sthg like that may overlap with next instruction see manual for more precise details. I tested it, and it's true. I use it for clearing
a screen 320x200xTC in less than one vbl. If anyone has a fastest rout, I'm intersted in it.
I tried with the BLiTTER, it's slower - in fact, with my code-.

Well it does speed up the screen display by a factor of 4 or more. Text is
9 times faster. That makes a big difference with MTOS.

I am pretty sure that the HINSTALL program from hdx writes a new bootsector
if you choose install driver.
Anyway, you can't loose if you try:
Boot from a clean system (of course)
Run AHDI from your (write protected) floppy
Run HINSTALL from your --||-- --||--

It might just do the trick.

> error-correction and data-compression?

Only in theory, and only on a VERY repetitive file. I've got a 512k file here that consists of nothing but the character 'T', that I use to test modem throughput. In actual practice, your throughput on a 14.4k modem with error correction and data compression will very depending on the data, but you ought to be able to get around 2400-2500 cps, assuming that you have a serial port that will run that fast. An unmodified ST does not. The best you can get without modifying the serial port on an ST is 1920 cps

Later,
Gizmo

From: kazial@cs.buffalo.edu
Message-ID: <Cqvvy7.I0r@acsu.buffalo.edu>
Source record: 185967

Looking to buy midi ST/STE system for sequencing/librarian purposes with reasonably sized HD, would entertain buying a used Falcon (would imagine price and availability might rule this out).

Are there any places that sell the ST/STE/Falcons still (I imagine not)?

Main purpose - cheap alternative to get feet wet with Kawai K4 midi usage

I recently came across a deal for a 520st 1 M Ram, color monitor, master transport, and master tracks pro (but no HD and one floppy) for $500.. seems too high especially without a HD..

Opinions?
Anyone selling what I'm looking for/know where to look?

Please reply via mail to:

Craig

3997. Midi port as modem serial port?

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 19:11:01 UTC
From: selick@acs4.bu.edu
Message-ID: <2sqjk5$f6o@news.bu.edu>
Source record: 185954

Can the Midi port on a 1040 ST/e be used as a 32k baud serial port for a 14.4k modem? I realize you wouldn't get all of the fancy signals in a 25 pin wire, but wouldn't you be able to use xon/xoff software handshaking, and use the midi port for serial i/o? My Stalker program has an option to use the Midi port, at 31,500 baud.

Thanks,
Steve
P.S. perhaps I could use send/receive on Midi and all other signals on the standard serial port?

>he will not tell.

I spoke with Bob about his decision to leave, and it had nothing to do with Atari's financial future. It was a personal decision based on his desire to spend more time with his family, and his desire to seek a new challenge. He had little opportunity for advancement at Atari Corp (unless Jack adopted him), and like many people, wasn't content to remain static for the rest of his career. Remember, too, that Bob was first and foremost a computer hobbyist, and not a videogame fanatic. Atari's focus for the next couple years will be the Jaguar, and not a computer line. Would you stay in a job where you had little chance for advancement, were expected to spend long hours at work, and wouldn't be able to spend time on the part you liked best for another two years?

4000. Quick text editor

Newsgroup: comp.sys.atari.st
Date: 1994-06-04 19:36:23 UTC
From: jpb3@ukc.ac.uk
Message-ID: <8244@merlin.ukc.ac.uk>
Source record: 185955

I have been looking for a quite specific set of requirements for a text editor for ages now, and have come up with a blank. I have therefore posted here, to see if any of you can help.

What I am looking for is a very simple text editor, that runs very quickly (Probably non-GEM therefore). Basically I am looking for the speed of the Revenge document displayer, but also be allowed to edit the text. :-)

Oh, and while I'm talking about Revenge, when I got the latest version, v3, I wondered what suddenly made the author make a bad decision about a feature the earlier versions had.

I used to use Revenge to show 80 column documents when I was in ST Low Rez. Now, if you try and run Revenge in Low rez it helpfully tells you to swap resolutions... WHY ?! Is my question.

Oh well, enough of this ranting, time to sign off,

he's in the net, why not EMail him on scoates@filesys.demon.co.uk and
bug him for the RDE (Revenge Document Editor) .. I am always trying to get him
to write it, but since he's my best mate I guess I can get away with it :-)
But seriously, I think he just needs a little encouragement.

If I remember correctly this was done due to some changes to allow
it to support any size of screen (Falcon, Overscan etc..) again a suggestion
in his direction might bring this ability back..

Connect allows this as well, at 31250 baud. I suspect that you will have a
hard time finding a modem that is willing to talk at this speed, but I
could be wrong.

If you want speed, look at Tempus II. It is extremely fast, and works well
in color. It is not simple, in that it can do just about anything a text
editor can do. All keyboard commands are totally reprogramable. It was a
commercial product, but I don't think it is being supported anymore. You
could probably get it on the used market for a very reasonable price.

Just set STalker to the 19,200 speed and let the modems at each end
take care of the actual connection rate by handshaking. As long as your
terminal software is set for a rate faster than the modem, the modems
will fall back to the appropriate rate.

Try MicroEMACS. Or better yet, my derivative of it, called GNOME.
(Generally Not the Original Micro Emacs ;-) (Not to be confused
with the much larger "microEMACS" programs that grew out of the
original small microEMCAS.)

GNOME is one small self-contained executable (about 55K, 35K after
compression with Packer :-) with built-in brief help. The best
part is that I use the same editor on MS-DOS and UNIX. The
source code is about 220K, in C.

Won't display 80 columns in low-res, though. Sorry. Will do 40 columns
with the rest of the lines off screen, and you can scroll horizontally.

>yes, they should be removed (IMO), but I'm not gonna bust my ass over it.
>But to CREATE a newsgroup that will be devoid of postings...That's
>something else entirely.

Ooh, devoid of postings... precious little traffic. This is the sort of
arrogant flame-inducing posts that led to your self-imposed exile from
.advocacy, much to the relief of those who enjoy intellectual discussion.

You would improve a lot if you simply interted "I think" or "It is my opinion
that" in front of much of what you say, instead of bandying your ideas as
facts.

As far as this discussion goes, the whole voting procedure is to ensure that
there is enough interest in the newsgroup in order to create it. I think that
the 200+ to 30 shows that there is enough interest in order to generate
sufficient traffic.

>REALLY have to lighten up and get lives, y'know?

Boy, looks like another case of Thanatosis. "Innoculous" statements
implying that there is nothing new in the ATari area, which is false indeed.

>But anyway...I want to make something crystal clear. I'm not enthusiastic
>about a comp.sys.atari.announce group for the reasons I'd already stated.
>Someone asked for comments, I gave it. Period. Any more questions will be
>deviated to dev/null, thankyouverymuch.

Yes, I am specifically responding to this because it was posted by you. You
are in dire need of an education in humility, and I shall do my best, though
I doubt anything I can say will make any sort of impression on you, deluded
as you are.

>(And Mikey...This message isn't tended to be a barbarous attack on you,
>so please don't take it that way.)

So why even post it as a response to him? You only serve to imply that his
post (which was far more harmless than anything you've ever posted) is one
of the "hate-mail" replies which you have received, thus destroying your
credibility even more. Why not point fingers at the actual culprits?
I doubt they exist except in your paranoid delusions.

] I think (well I'm quite sure) that I have a virus resting on the boot
] partition of my hardisk :-(I think it's a 'Goblin Virus' or 'Ghost Virus'
] and they are boot viruses which means that I can't cure it with the virus
] killers I have (they only allow for link viruses on the HD).
] So could anyone help and suggest a program (commercial/PD/Shareware, et
] I don't care which) that will allow me to cure boot viruses on my HD.

Usually a virus on the hard-disk will prevent it booting altogether
as that's where the loader information for ICDBOOT.SYS lives.

If you are using a supra system, then that's different!

I registered "Antidote" a few months ago, which will do what you want.
It will scan the boot-sector of *ANY* bootable device on the system,
and scan all drives for link-viruses. A shareware version is available
with the 'last' issue of Scriba-Communis-Responsi which can be
obtained at Atari.archive.umich.edu in the atari/Mags/DiskMags/Scriba
directory! Great program, if you want a *GOOD* virus killer, check
it out!

(From memory, the registration fee is only $10US, and it's being constantly
updated!)

4023. Files help

Newsgroup: comp.sys.atari.st
Date: 1994-06-05 08:24:04 UTC
From: gungfu@csd4.csd.uwm.edu
Message-ID: <2ss234INN8tu@uwm.edu>
Source record: 185974

I have a question: Are most of the files at the Atari archive for
the newer TOS and ST models only?

I have a stock 520ST from around 1986, in fact it was when they just started
putting TOS on the chips.

I tried loading the Kong game found at the site, and it crashed with error
008. Then I tried the Combat game, and I got the startup screen, drive
goes, and then it sits there as well.

Is this something I'm going to find with all the programs at the site?
I noticed in the Index's in each directory that sometimes it says what
system it's actually for. I assumed if it didn't, it would work on all.

Thanks much.

4024. Re: Midi port as modem serial port?

>the Midi port, at 31,500 baud.

STalker has the MIDI port option for hooking 2 STs up directly
via MIDI. It IS possible to use the MIDI port as a 31.5kbps
serial port, but you'd need a box (which, AFAIK, doesn't exist)
that would give the RS-232 support that the MIDI port doesn't
have and handle the MIDI<>RS-232 translation. It would be
interesting if someone came up with such a box, though (as it
would a box for the MSTE/TT/Falcon030 LAN port that would
convert it into a multiple modem port (230kbps = 4 56kbps ports!)
so that they could be used for multi-line BBSs!). Okay, so I'm
an optimistic, wishful thinker! <grin>

You use 19.2kbps -- you'll get better performance at that speed
anyway with V.42bis compression (I usually get around 1600cps
for binary files and around 1900cps for text files). You just
need to make sure you have all the settings right so that there
isn't a speed mismatch anywhere.

>
> NOW what do I do?

Set it to 19,200.. The limitation is not within Stalker, it is with your ST
which cannot support 14,00!! your modem should be able to support a DTE
speed of 19,200 (modem to computer) whilst a line connect of 14,000 is
operating.. thats how I always have mine setup anyway.

Error 008 usually means out of memory. I assume these games require 1 Meg
of RAM or more and you only have 1/2 Mb?

4030. FalconSpeed 286 -performance?

Newsgroup: comp.sys.atari.st
Date: 1994-06-05 11:20:13 UTC
From: marvi@Krille.Update.UU.SE
Message-ID: <2sscdr$194@Krille.Update.UU.SE>
Source record: 185984

Have any of you Falcon owners out there installed FalconSpeed 286 in your bird?
I would very much appriciate some notes one how it is doing.
It is a Intel 80286, right? What about software that demands a 386? Is it
using the 68030 in any way, to make it go faster? Is it possible (in real life -not in
theory) to run Windows? Can you use PC communication software. or does the atari serialport
complicate things?

TIA Markus Haernvi

Many thanks to all who responded... And now I have another question...

U.S. Robotics claims that with V.42 bis compression on both ends (as is promised, here at Penn), you can get an "effective" BPS of 56,000. I've been following the discussion on the Maximum speed of ST serial communication--I've gotten HSM v. 4 from a German FTP site.

Would I have anything to gain, speedwise, by going in through the "Serial 2" port now in my Mega STE 4's VME slot? Or is this delay more a function of TOS?

Double thanks again.

"Effective" is too strong a word. "Potential" is better. The v.32bis protocol has a potential compression of 4x1, with a ceiling of 57600 baud. However, you will never get that in real world use (maybe if you downloaded a couple of megabytes of the letter "a" or something). I found that for binary downloads of compressed archives (using Zmodem), I get around 1650-1700CPS, which implies that I am getting some help from compression, but not a great deal. Text, which compresses much better, receives more help, but very rarely anywhere near 57600 baud. It is my opinion that you will get 95% of the modem's potential performance at the 19200 baud setting. Of course, this is an educated guess.

> Would I have anything to gain, speedwise, by going in through the
> "Serial 2" port now in my Mega STE 4's VME slot? Or is this delay more a
> function of TOS?

It is more a function of the v.32bis protocol and the real line speed of your modem (14400). You may get a slight increase in performance, so I would say "go for it". Unfortunately, many MegaSTE Modem2 and Serial2 ports are buggy. See "fser09b.lzh" on atari.archive:/Utilities/Tosfixes for details on how to fix them (unless you are one of the lucky ones for which they work).

I intend to fix mine, and will perform some comparison tests when I do (text and binary speed tests at 19200 and 57600).

Here is another interesting question: will it work with the new drop-in
486 upgrades for 286 boxes? I saw a press release for a chip-replacement
286 upgrade that greatly speeds things up, and will be detected as a 486
for software that cares (Windows, for example).

I recall mention of something called a "Chro-MAGIC Multisync Gizmo" for the Falcon that will allow switching of a multisync between VGA and RGB on the fly. Anyone know where I can aquire this thing in the U.S.? A similar product?
Thanx

4041. Calamus SL and HP560C color printing

Newsgroup: comp.sys.atari.st
Date: 1994-06-05 17:24:18 UTC
From: michaelk@pacifier.rain.com
Message-ID: <CqxpoK.y4@pacifier.rain.com>
Source record: 185997
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had nothing but frustration trying to gain acceptable color print-out results with documents which contain imported graphics (TIFF,IMG OR GIF) from Calamus SL using my HP 560C (uses 550C drivers) printer. My set-up is: a Falcon with 4 megs ram, VGA monitor in 256 color mode. I know the prints can be ALOT better because I also use Image Copy 2 which provides excellent results - smooth dithering, with screen and print colors virtually the same with very little adjustments.

In Calamas GIF is the only format which will even print an image similar to the screen. I have tried adjusting the Color Seperater Control lines, the Linearity Control lines and the Raster Generator pixel relationships - which all make alterations to the images sometimes , but do not improve the print quality when compared to Image Copy results. The results are always off color with high or low contrast and a grainy image which looks closer to 8-bit then anything else. Also the screen image for an import is never as smoothly dithered in Calamus as it is in Image Copy. When using TIFF or IMG the printing consists of series of dithered bands . I know this only affects import images because when I print a document which contains a colored, pattern frame from the Raster Area Module , that particular frame(s) prints out as it looks on the screen.

Of course my hope is that I am doing something wrong , that Calamus which is considered to be a top-end DTP program, would give me some of the best printed results. Or is that my fear that the Graphic Import Modules and /or HP 550C drivers is one of Calamus SL's weaker areas.....Any help or comments would GREATLY be appreciated.

MBB>ST/STE

Sorry, but I think you're wrong.

I have a very early model of the MegaSTE series and with HSMODA04 it's no
problem to get a _reliable_ DTE-speed of 38.400 on *Modem2/Serial1*. I
cannot
go higher due to the hog in the harware. There is a simple patch for a
GAL/PAL available to fix that.

MBB>this that should be very easy to install. See my other (big) post on
MBB>modem stuff for more details. Hope that helps.

Nice work, although you slightly mixed *baud* and *bit/s* ;-)

At about twenty past four, boyd@math.fsu.edu (Mickey Boyd
(boyd@gauss.math.fsu.edu)) wrote:

```
MBB>+--------+ +------+ +------+ +--------+
MBB>|computer|<----->|mod 1 |<---.........--->|mod 2 |<----->|computer|
MBB>| A | x1 +------+ x2 +------+ x3 | B |
MBB>+--------+ +--------+
```

x1 and x2 = DTE-Speed.

MBB>Again, I doubt that you will be able to achieve any major advantage
MBB>from a 57600 data line, given that you are using a 14400 baud v.32
MBB>modem (very common). Once the v.fast standard is settled upon, this
MBB>might change. The v.fast protocol has a 28800 baud line speed (x2
MBB>above), and supposedly has a potential of 10x compression (though
MBB>that is probably _very_ potential, as with the 57.6k potential for
MBB>v.32).

A typical modem at V.32bis uses a single carrier at 1800 hz with a
modulation-
clock of 2400 baud. In every phase 6 bits are transferred.

=> 2400 baud x 6 bit = 14k4 bit/s

You'll have a slight advantage witk a 14k4 modem. If you're using a 19k2
terbo model you _have_ to go beyond a DTE of 19k2 otherwise your modem
would
be idle too often. Not to mention the future V.34 models.

>putting TOS on the chips.

Generally, any programs there should work with any ST system unless
mentioned that it is Falcon/TT/STe-only (and these generally have
their own directories.

HOWEVER, it might be safe to assume that most new software probably
won't limit themselves to anything under 1 meg, so if you're there
with a 520k machine, there's a good chance you simply don't have the
memory to run a lot of the stuff (sometimes it will mention this in
the docs, sometimes it's assumed)...

Your TOS version could be a factor (since it's most likely TOS 1.0),
but probably doesn't play as big a part.

In my opinion (<- emphasis on "my") the minimum useful setup would
have to be a 1 meg, TOS 1.4 system. You can get away with less memory or
an earlier TOS, but then that's like using an XT machine in a 386+ world
(i.e. most of the stuff need more these days)...

I know, on my MegaSTe/4 (TOS 2.06) I still could use more memory
for some of the things I'm running (like MiNT)...

>using the 68030 in any way, to make it go faster? Is it possible (in real
>life -not in theory) to run Windows?

Not to blast the makers of the FalconSpeed 286, but in this day and age,
a 286-based anything is really wanting of usefulness or power. There are
a good amount of things you can run on a 286, such as WordPerfect 5.1,
Harvard Graphics, etc, but you can pretty much write-off any of the
newer, "cooler" software, as most *require* at least a 386...

As for Windows, I think you can run Windows 3.0 on a 286 (not sure
about 3.1), but trust me, you REALLY don't want to. As an example,
I run Windows 3.1 on my 486/33 at work, and I am still frustrated by
the speed factor of the software - a 286 would be like pulling
teeth with a hammer (or taking a sex-ed course taught by Lorena
Bobbit ;-)

In my opinion (a very opinionated person I seem to be today ;-)
a 386/20 is the minimum useful system in the PC world today, and
a 486 is really the minimum bearable one *for today's software*.
The older software will run on any x86 software almost, but all the
cool Windows, multimedia, and other fun things pretty much need
a 386 or better (due to speed, and internal 386+ calls)...

Personally, I'd hold out for a 386 or 486-based emulator for the
Falcon...

>Can you use PC communication software.
>or does the atari serialport complicate things?

I'd imagine it would work. I *think* I sed to be able to run Procomm
on the old software-PC emulator for the ST years ago (but yikes it
was slow :-)

Really? FZT must be using the VDI then, I guess. Why do people use
Protext? Well, because it's a fast, highly configurable text cruncher
that's usable even on a 8MHz ST. Now I have a Falcon I'll be getting
something a little more GEMish though [g].

Yes, this is true. If you happen to be sending a raw file full of the
letter 'a' you'll probably get close to 56,000. Otherwise you'll get
around 3000 CPS on uncompressed and 1600 on compressed.

I haven't seen anybody else mention it, but a "fixed" version of Goal! has now been released by Virgin Games. It still crashes on 4MB STs and won't boot on TOS 2.06 (possibly something to do with the step rate), but a reset-proof ramdisk solves the first problem, and switchable ROM upgrades were made for the second.

More details in a few days, if I can drag myself away from the damn thing.

Incidentally, Virgin replaced my original disk by return of post.

Ha! Lord Chaos cannot be killed with ordinary weapons, no matter how strong you are or how much mana you have. You must find and complete the Firestaff and learn how to use it and Chaos has to be captured before he can be killed! Good luck, you'll need it. :-)

I don't have one, but the FalconSpeed 286 WILL run Windows 3.1
(even though Windows 3.1 recommends at least a 386 machine). It
apparently WILL run some 386+ software, but certainly not ALL of
it. It doesn't use the 68030, but since it uses the Falcon's
video subsystem, it has MUCH faster graphics than an equivalent
286-based system. As far as communication software is concerned,
I've heard that some work and some don't.

] I have a question: Are most of the files at the Atari archive for
] the newer TOS and ST models only?
]
] I have a stock 520ST from around 1986, in fact it was when they just starte
] putting TOS on the chips.

Not a great deal of recent software will run on TOS 1.0 or 1.2. This
is due to problems trying to code around OS oddities, most of which
is fixed with the major re-write of TOS 1.4!

Along this line, I was quite annoyed today when I downloaded around
1meg of files from ftp.uni-kl.de, only to find out that they were
Falcon only (Demos of course). Could people PLEASE stick a file saying
what machines they run on, and what language the programs are in!

The files in question were ARRIVAL.ZIP and CONFLICT.ZIP

UFO_WAR.ZIP is also Falcon-Only (Apparently).

Just a file called whatever.txt for the whatever.lzh/zip file is all that
is needed, it'd save a lot of hassle for all!

> : vbi and every second vbi?
>
> Because EVERY VBI is 30 times a second, not 60.
No... I don't know how this came up, but VBIs are 50/60 times a second, exactly the same rate as the screen-refresh (what else?). If you don't believe that, install a little routine in the VBI-vector (0x70), that simply increases a variable (it would be easier to do the same with the existing sysvars, but you could say the ROM's cheating). Then init this variable, wait for a certain ammount of time (using the hz_200-sysvar or any other timer) and then look at the difference between actual contents of the variable and the initial value. Divide this difference by the time in seconds and you have the VBI-rate. In US, while waiting 10 seconds, you will get about 600 VBIs, so this makes 60Hz. If you don't believe, do it.

I agree, I have Calligrapher Gold 3 and other than the lack of font
support it is a fine wordprocessor. Don't expect to do fancy DTP
work on it though. The graphics facilities are rather simple.

However for reports, letters and so on it is quick and simple to use.
It does have MailMerge and lots of nifty barcode type facilities which
are nice. I will have to look at Papyrus in a few months time to check
out its ability to automatically number references from a database
and automatically build contents pages. Until I find an Atari WP that does
this I will continue to use troff to format my reports.

SC> monitors.

I've already had my head kicked around by the programmeras in IRC because of what I'm about to say .. it's true though, and yes, I am a BlowUp Hard-II owner.

Hard-I is *NEVER* better than Hard-II ... Hard-II can do ANYTHING Hard-I can do, and MORE.

If you had bought Hard-II, you could choose a pixelclock from 33Mhz and up to 51.5Mhz in 0.6 Mhz steps. (or if it's 0.3Mhz, I don't remember)

Instead of choosing from the resolutions already in the program, try to make your own though .. that might work.

4081. Code Speed Was: Demos for Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 08:27:45 UTC
From: spatzene@Informatik.TU-Muenchen.DE
Message-ID: <2summ1$66v@hpsystem1.informatik.tu-muenchen.de>
Source record: 185922

I have written a Wolfenstein Version for the Falcon.

3. The main loop is (some parts removed ;):

```
moveq #200,d1
moveq #0,d5 ;Texture Count Hi
moveq #0,d4 ;Texture Count Hi
moveq #0,d0 ;Texture Data
.paint_it:
add.w d3,d4
addx.w d2,d5 ;Texture Offset
move.b (a4,d5.w),d0 ;Upper texture Part
move.w (a3,d0.w*2),(a0) ;move to screen
add.l a2,a0 ;add #320,a0
dbra d1,.paint_it
```

Question: Why get I with :

```
moveq #200,d1
paint_it:
add.w d3,d4
addx.w d2,d5 ;Texture Offset
move.w (a4,d5.w),(a0) ;Upper texture Part +move to screen
add.l a2,a0 ;add #320,a0
dbra d1,.paint_it
```

almost the same speed ???????????

: I run the 3.6 editor in 768x480 16 colors.

And now the solution: ;-)
GFA Basic 3.5E does NOT run in non-ST-resolutions EXCEPT those with only 2
Colors (that means monochrome). I use the Interpreter with 800x608x2 and there
is only a little problem with the Fileselector. With 16 colors you can only
use ST-Low (320x200).
With GFA Basic 3.6 you can use all 16-colors-resolutions.

>>50hz? They didn't make it support VGA, so they could have at least allowed us
>>to set it to 60hz so people in the US can watch it.

I just read the discussion about why our demo doesn't work with 60Hz and how it could be patched.

First of all: If your TV can't manage 50Hz, there is no possibility to watch it, because we set the resolution to 50Hz via Hardware-registers.

Why is only 50Hz, RGB supported?

- it was coded for the demo-competition of the Fried Bits II Party in Bremen, and we just finished this version 5min (five minutes!) before deadline.
There are still many bugs...

- on VGA and 60Hz you have less time, so you have to leave some effects away,
, or they are slower.

- we tried to synchronize the effects with the music, and if the effects would take more time, we would have to synchronize it again for 60Hz.

- it sound strange, but we never knew, that our demo will come to America, and that there are people watching our demo!?

We never got any response to our demos!
So, if you have a TV wich only can work in 60Hz or any other configuration, where our demo doesn't work. Please tell us.
If there are enough people, we will make our next demo run on VGA, and RGB 60Hz.

I agree that you need to write your own code for older versions of the AES,
but your code should detect if it is running with a newer version, and
use menu_attach etc if they are there. That way, your program will behave
the same way as other programs on any new AES, even if that behaviour
changes in subsequent versions. (Of course, it doesn't really look like
there *will* be any new versions of the OS...)

>You will probably get better results with Hard 2. Contact Seibert with the
>spec of your monitor for more accurate advice.
Indeed, I wish I had bought Hard 2 instead of Hard 1; I need an in-between
pixel clock rate to get square pixels with my monitor. Instead, I have
an odd aspect ratio when using BlowUp. Unfortunately, no supplier
(including Systems Solutions) had, or knew when they could get, Hard 2
at the time.

I do use the 50MHz clock rate in 16 colours. The key was to edit the
parameters with the SVGA button pressed in, so that the BlowUp config
program is not changing the resolution on the fly. (After all, if you
have a resolution that works with 32MHz, something is quite likely to go
out of range if you just hit the 50MHz button). Then adjust the X and Y
resolution until the H and V frequencies look OK for your monitor, THEN
hit the MS1 or MS2 button and make final adjustments.

BlowUp (or some similar enhancer) is the third most essential puchase
for your Falcon (IMO). The first is NVDI, and the second is a better
mouse. The mouse being sold through ST Review for just 9.99 is much
much better than the Atari one.

From: petep@info.isbiel.ch
Message-ID: <2sure0$3g8@vega.info.isbiel.ch>
Source record: 185936

i use the resource counstruction set distributed from atari (version 2.9)
for my own applications.

i changed now the name of a menu-entry and saved the new rsc file. cause the new
.h-file i recompiled my programm (with PureC) and started it. my application begins
to draw the menu, but suddenly it stops and the only thing i can do is rebooting.
i think it must be an error produced by the resource construction set. any idea
how i can fix this, or do i have to rewrite the hole .rsc?

4088. Installation of finger/fingerd

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 10:08:02 UTC
From: tj@aiscube.AIS-dortmund.de
Message-ID: <2susi2$gm7@aiscube.AIS-Dortmund.DE>
Source record: 185938
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello Netter's

After i received a lot of mails on how to install the finger-tools, here
are the most important points to watch out for:

- do not try to start the fingerd in rc.net! it has to be started by
inetd. Look into "etc/inetd.conf" and read the MiNT-Net Documents.

- If your "finger" is not in /usr/bin, make a copy or a link, so that
/usr/bin/finger is existent. Otherwise your machine will not send out
any infos (fingerd calls "/usr/bin/finger")

- and PLEASE, PLEASE, don't send me more mails on what finger is, and
what it does, and how to use it ....

Believe me, threre are a lot of books, which describe daemons, tools
and basics of Internetworking.

I've got POV 2.2 working now, compiled with GNU C 2.5.8, but it's 1.5
times slower then the binary of POV 2.2 compiled with Pure C that is
on most of the ftp sites.

The FTPOV sources should be on:

ftp.informatik.uni-oldenburg.de
wuarchive.wustl.edu

Unfortunately, the author did not give a path for them, but the archive is
FTPV20S.ZIP

4093. pop up menus?

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 11:45:37 UTC
From: mdekker@fwi.uva.nl
Message-ID: <2sv291$4ts@turing.fwi.uva.nl>
Source record: 185946

hi,

this weekend i thought about how nice it would be to have a pop-up menu
on the desktop with all your favorite programs in it (like under X).
pondering on how to program such a thing i got real enthusiastic about
the idea. So: does such a program already exist (for a ST)?
if not, i will write one (or try to write one ;)

hi,

i got a very old apple mac (512Kb RAM) and i got a 1040STfm. Can i
connect the two? i want use my atari as a 'server' and the mac as
a terminal? what cable is required? what software? any ideas?

ps. my atari only has 1Mb RAM, so not much to set up a decent 'server' but
i just want to play a little with it

4097. Database SW: DB ONE, USEONE, MAKEONE

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 12:58:43 UTC
From: rappleye@felix.kodak.com
Message-ID: <1994Jun6.125843.18350@kodak.rdcs.kodak.com>
Source record: 185860

I've got a positively ancient piece of database shareware called DB ONE. The executables are called USEONE.PRG and MAKEONE.PRG. If anyone has any experience/information about it I'd appreciate it. Tried to register it a few years ago and got my check back as undeliverable.

It's actually pretty good, though primitive. I'm looking for any documentation or even a version later than 1.0. My wife has managed to uncover a few sequences of actions that make the data files inaccessible (frequent backups required).

Anybody got suggestions regarding other database package(s) that will run on a 1MB STFM with no hard drive? Thanks. Post if it's of general interest or email to rappleye@felix.kodak.com

>if not, i will write one (or try to write one ;)

I don't think such a thing exists for the ST yet. The *closest thing*
I could think of was a DC (Double Click) program that provided a pop-up
of the menu bar, but that's not what you want...

Do you have access to a PC with Windows? If so, try out something
called "Backmenu" - it would make a good guide to go by (on a right-button
click, it displays a menu (that a person can configure with a
text editor) listing names of files to run, and submenus etc, as
well as currently running tasks (which would be cool under Geneva/
MTOS/Mag!x), plus misc options. I basically hide my Program
Manager and just use this thing...

I dunno about the task list (which is possible, since for instance
Geneva lists everything tasking under the left-most menubar),
but just a menu for programs to run should be very achievable...

If you do, I'll be happy to help test it :-)

There was a defreg/optimizer with DLII I believe (called REORG.PRG
I think), but it's older software, so I cannot attest to its
abilties or robustness, but I suppose it's something to look for
(DLII is at atari.archive.umich.edu and other FTP sites)...

4102. RSVE

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 13:33:38 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2sv8ji$5ks@golem.wcc.govt.nz>
Source record: 185857
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have had a look at the High Speed option called RSVE..

What you are going to need is a GAL 16V8 and HC4040
and a Crystal Oscillator 1.8432 megs...

Note: not just a Xtal but a full Crystal Oscillator...

The main problem is to program the GAL...???

What this does is to replace the MFP 110,134, and 150 bps clocks,
with new faster clocks...

The thing is completely automatic, the GAL detects these speeds comming
from Timer 'D' and replaces them with the new faster clocks to the MFP...

So. 150 = 115200
134 = 57600
110 = 38400

There is also a Led to show when he new speeds are active, also
there is a small program to set up a Cookie, so that other programs
know that 110 bps does no = 110 bps but 38400, one such program
is Connect...

There is a mention to TOS 1.6, but I think that is to do with the
Cookie, if I remember correctly, the real Cookie was not implemented
till TOS 1.6, but I stand corrected on that one...

I hope this is of help, if not please e-mail me or post here...

^^^^^^^
Ooops it must be $ff820a.w There are so much adresses floating in my head.

Instructions (only in : bset #0,$ff820a.w ; switch screen off
supervisor mode.) : bclr #0,$ff820a.w ; switch screen on.

>external sync input. With no external sync input the shifter will not
>start displaying a screen thus the shifter will not acces the memory.

>Warning. I don't know if your monitor likes this since it doesn't get
>a proper signal.
>
>Robert Demming (robertde@htsa.aha.nl)
>

After I came up with this idea I tried it this weekend.
I tested it with a home made 68000 program to calculate all posible letter
combinations which you can make from a word (eg. from 'bye' you can make
b, y, e, by, be, yb, ye, eb, ey, bye, bey, ybe, yeb, eby and eyb)
I tested it with a 8 letter word with a screen frequentie of 50 Hz.
I measured both times two times.

With screen on: 27 min and 5 sec = 1625 seconds
With screen off: 26 min and 42 sec = 1602 seconds
--- -
That's 23 seconds faster.

Or a speed increase of: (1625-1602)/1625*100%= 1,415 %

This means that you must have a job of 70 hours and 40 minutes and 17 seconds
to gain 1 hour time.

The conclusion of this is that the ST doesn't suffer very much from bus
contention caused by the shifter.

I hope that you found this interresting.

Bye,

Robert Demming (robertde@htsa.aha.nl)

P.S. Something about the warning. I had no problems with my monitor.
No strange peeping or whatever when the screen was off.

That's strange. The German demo CAN be given away.

>It really is a wonderful program

I know. I've been using it for almost 2 years now.

>(it is getting a spell checker, according to Dave from Hisoft)

Correct. Christian Nieber (the programmer of papyrus) did show the spell checker at the Fez-A-Bit computer fair on May 7/8 here in Berlin. I was really impressed how fast and easy it works and that even various dictionaries can be used.

Also, PAP 3.5 will provide a function to turn of its desktop, which is a nice feature in a multitasking environment (I'm still waiting MagiX on F030).

Get the optional Bridge module if you want postscript. The postcript code
output is much better than the previous Dataformer module, and Bridge
also does lots of other conversion thingywingies.

Yup, the maual is f****** awful. Look in the index for mount and print,
get the page/chapter number which is listed, look it up and... its not
there.

There should really be documentation for ALL supplied modules.

4116. Re: FalconSpeed 286 -performance?

Newsgroup: comp.sys.atari.st
Date: 1994-06-06 17:23:18 UTC
From: millert@undergrad.csee.usf.edu
Message-ID: <2svm26$h16@mother.usf.edu>
Source record: 185865

If FalconSpeed had, say, a 386sx at 25mhz AND it used the 68030 to MASSIVELY accelerate graphics, then it would be acceptable. There is LOTS of software that REQUIRES the 386 protected mode, and a good thing since it's FAR superior to the evil Real and 286 Protected modes. One of the major bottlenecks on the PC is the speed of the graphics, so even a 386sx/25 would perform almost reasonably well under windows if the CPU didn't have to deal with the graphics.

We've never had any problems with Calamus SL outputting color graphics (except once when printing to an HP Deskjet 500c with the wrong settings in the printer driver). Contact pdirect@delphi.com and ask him about it. He can help you with your problem.

I think Atari's popups are simply not good enough. My popup routines allow
you to use the keyboartd shortcuts and arrow keys as well as other
facilities. That will not work with the GEM 3.x/4.x popup routines.

The next version was called BASETWO. It was sold through ANTIC, and is still available at places like E Arthur Brown. It is an extremely easy to use database, with a few serious limitations. The biggest advantages are the ease of use, variable sized, multiline fields, relatively easy modification of data forms, all data kept in memory (= fast) and the ability to save 10 report formats with each database. Limitations include a couple of bugs in report output and formulas, and incompatibility with TOS >1.2. My wife uses it to manage her business, and I use it for a number of activities. We are converting some applications to AtariWorks, but several of them cannot be done as easlity there.

Which is pretty pointless because the data will go at 1920CPS tops. Only send uncompressed data if a) you can't be bothered to compress it [g] or b) your serial port can be set to 38400 (or higher).

Additionally, they don't work 'both' ways - ie hold-move-click and
hold-release-move-click. Take a look at the Selectric or Connect popups to
see what I mean.

Do not buy Calligrapher (any version) if you own a Falcon, or have plans to get one... That program is so damn buggy that you'll lose your mind! On ST it works rather nicely, even if slowly. Accelerators recommended! Basically it is a good program with tons of features. If they only had finished it.. ;-(

I've been using this for about 6 years to keep my book collection on. Sort of anyway as I have't actually updated it in over a year. Mainly because it does not like my Mono MSTE with TOS 2.06. Its not a great fan of my Colour STM with TOS 1.4.

Unfortunatly once you set up a database for a particular resolution, it can't be changed - and I unfortunatly set it up for Colour!

TOS > 1.0 is the other major stumbling block. TOS 2.06 is definatly out. TOS 1.4, I can't remember off hand - its been so long. I have a feeling that it works from an TOS 1.0 on a floppy.

I don't have any docs, but I've had most of the features working.

I keep meaning dig it out and bring my database up to date. I'd really like to transfer the data to something newer though.

:-)

Roland.

@CiX

BTW I wasn't aware it was shareware. Atari gave it away with the original STs in 1986 in the UK. There was a comercial version I remember. Don't know the name though.

I didn't recognise ttyname() so I looked it up. Excuse my ignorance but
tt doesn't seem to be a particularly useful function under TOS?

Under MiNT it could concievably be more useful as there is a proper /dev
directory with proper device names (including ttys).

It might be in the latest GCC MiNT libraries. Alternatively if you
elaborate on exactly what effect you are trying to achieve - then maybe
somebody can come up with a TOS work around.

:-)

Roland.

That's right. The Gfa Basic 3.5E only work on ST-resolutions.
The 3.6 works at 2, 4, 16 colors in all resolutions. I'm using 800x608x16.

For that matter, has anyone got it to work on a Falcon!? I bought the ST Review with the cover disk on it, cost me US$9, and the bloody thing doesn't work. On exiting from a color session, it gives me two bombs and corrupts memomory, and in the monchrome it doesn't. BUT in both modes, nothing is displayed on the pages, but it prints out fine!

>S> I need (Ha! *want*) a good DTP to do the company news letter, occaisional
>S> promotional material and proofs for the adverts we run. The two main
>S> contenders seem to be Calamus and DA's Layout.

Darren,

another main contender still happens to be Pagestream, even though
Softlogic has stopped support for the atari, it has *.ps output already
built in, and though it may not compare in many ways with SL, it is cheaper
and better than I guess it's B/W counterpart of Calamus 1.09N

As for comparing Calamus SL, the Digital Arts Desktop Publishing
Program is DA's Complete DTP System which consists of DA's Layout and DA's
Repro (in BW/CD or TC versions) and is IMO far better than Calamus SL because
of Repro (the followup of Retousche Pro). Also note that DA's DTP System has
a whole row of other applications to complement it such as DA Picture and
DA Vector (Pro too).

>S>
>S> Any ideas anyone?
>S>
>
> Definately Go with Calamus SL, the best DTP program on the computer market,i
>have worked with DTP on the IBM and MAC but nothing beats calamus. in fact DMC
>have just released it (or are about too) for the IBM market.
>

You need to run Calamus with Window's NT, and until 4.0 is released many
people cannot justify the high price tag of a system that can adequately run
NT ASWELL as the price of NT as an OS.

Also as always, many programs are a matter of agreement with the user, I know
several people who cannot work with Calamus and love Pagestream, on the other
hand I know plenty people who much prefer Calamus, mostly programs are a
matter of preference and of what you expect of it. IMO if you have a
1040 ST don't use Calamus *grin* OR DA's DTP System, as they will run at
a terribly slow speed, and even though Pagestream is not a speed wiz, it is
more suitable for B/W work.

Another program is Timeworks Publisher, compared to DA's DTP or Calamus SL it
is a very small contender, but by far the cheapest commercial package and
suitable for 1040's alike.

If you have a TT system, Medusa or a Falcon(preferably sped-up) and/or high resolution graphic boards the use of those packages makes much more sense.

Best thing is to possibly find someone who has Calamus and another person who has DA's DTP System and look at the programs in action...(or on who has both)

Cheers

Yat

Thanks. I'm surprised that you missed the section that specifically addressed
the MegaSTE ports, distinguishing MODEM1 from MODEM2/SERIAL2.

Also, is it not the case that baud and bits/sec are equivalent? I always
thought the terms were interchangable, and my Webster's Handy College
Dictionary seems to agree with me (not the most magnanimous of tomes,
I admit).

4136. STE Hard disk

Newsgroup: comp.sys.atari.st
Date: 1994-06-07 05:20:13 UTC
From: dak@latcs4.lat.oz.au
Message-ID: <Cr0HHp.2yJ@latcs1.lat.oz.au>
Source record: 185892

I'm a newcomer to the Atari world, and need some basic information
on attaching an external SCSI HD to a vanilla ST(e). I understand that
though there is a hard disk port in the back of the unit, that it's
not particularly standard. So:
* What sort of controllers/adaptors do I need?
* What sort of software (i.e. disk drivers) do I need?
* How much will this sort of stuff cost, and where
am i likely to find it?
* Or, at least, is there a FAQ list for this kind of thing.

Replies by e-mail would be appreciated, as my news reading is erratic.

Thanks,
Dak.

Back when the STE first came out and people found out FALCON
wouldn't run on it, Spectrum Holobyte said they'd fix it if
there were enough STE owners to make it worthwhile. However,
due to poor sales of Atari products, they dropped Atari
support altogether (and the chances of any official fixes as
well!). Since then (almost 5 years now!), NOBODY'S gotten
FALCON to run on an STE/MSTE or TT030. And nobody's gotten it
to run on a Falcon030 for the past 18+ months either! The
only HOPE of getting it to run it seems would be for someone
to 'hack' a fix for it. However, nobody's been willing to do
that for 5 years, so I don't know if anyone interested in
doing it (since distributing a fix may be illegal as well!).

Most TVs have a V-HOLD (vertical hold) control which can be
adjusted to display 50Hz signals. The drawback is having to
re-sync it back to 60Hz when you're done (and sometimes
getting to the V-HOLD control in the first place! <grin>).

I just realised a few days ago that my TV apparently auto
adjusts to 50Hz (and even re-positions the screen accordingly!).
I was shocked considering what a cheap TV I have, but maybe it
is like my SC1224 that's set just well enough that it will
accept either a 50Hz or 60Hz signal without rolling.

: Rob
As far as I know, you mustnï¿½t copy all the files from the disk to you external
HD. At least, Mint has to be in the AUTO-Folder and the files GEM.CNF and
MINT.CNF have to be in the Root-directory of your boot-HD. Then you have to
change the GEM-Path in the MINT.CNF to the file GEM.SYS and the PATH in the
GEM.CNF to the MULTITOS-folder. There might be other things to be set, but
I canï¿½t remember them now.
I hope this works, but if it doesnï¿½t, send me a PM and Iï¿½ll have a closer
look at the setup done by the INSTALL.PRG.

[can't answer the other points]

|> - Can BlowUP030 be fitted inside?

BUT:
BlowUP030 can be included in a tower like the TEAM-Tower.
But more important:

There is a tower-version of BlowUP030 Hard I availavle since April.

RS> move.w(a4,d5.w),(a0);Upper texture Part +move to screen
RS> add.la2,a0;add #320,a0
RS> dbrad1,.paint_it
```

Try:

```
moveq #200,d1
.paint_it:
addx.l d2,d5 (This requires a swap after the DIV)
move.w (a4,a5.w),(a0)
lea 320(a0),a0 (You cannot use another add since the addx won't work)
dbf d1,.paint_it
```

(I don't see why you're adding a2 to a0, I don't .. ;)

..it's also faster to do it horisontally, and use (a0)+ above instead of the lea ...

Using only addx.l instead of add.w/addx.w will yield a VERY small error (think about it!) but it's NOT noticeable ... I've used this engine in my own Wolf/Doom clone (on which I'm doing nothing since I now have a PC instead of my Falcon ..). Using only addx.l means also you cannot use another add or sub in the loop, since that'll screw up the x-flag.

I hope it's understandable, please Email me if you don't get it to work.

The best that I have used is Ataries Checkdisk 3, you will find this on many FTP sites, also a Frence one called Zorg134.lzh, this I have no tested, but its on A.A.

Note: you must do a clean up of your hard drive befor you try and optimize your hard disk or you can end up loosing some files...

I only use ICD's CleanUp for this....

Checkdsk3 has never caused a problem with any of my hard drives, a can recommend it some 100%..

I was actually planning to buy a Falcon fairly soon.

What's the problem with running it on a Falcon ?

I see that the other thread seems to have diverted to Papyrus ;-)

Does anyone know the cheapest UK price for Papyrus, are there different
versions of that available and does it run on the Falcon OK ?

Any comments ..... ?

4149. GEM-list changes

Newsgroup: comp.sys.atari.st
Date: 1994-06-07 10:11:05 UTC
From: lexicor@cs.bu.edu
Message-ID: <2t1h3p$3p2@news.bu.edu>
Source record: 185805

1st June 1994

Dear List Subscribers,

As it appears and as most of us had expected, it is extremely
difficult to cut down the volume of the Mail on gem-list, I will therefore
kindly ask all member of the gem-list to digest their mail.

In other words, read the mail and then respond to 4-5 different
people in one mailing to the list, this will make it a lot easier to read
and handle, especially for people who are on Mausnetz.

4th June 1994

Dear List Subscribers,

I have discussed with several people on the topic of how to cut
down mail and make the list much more manageable. Thankfully the volume of
Mail has indeed been cut down to an average of 15 or less messages a day,
as supposed to 40+ messages a day. However we were considering the fact
that there will be many more members on this list at a later time, and that
the messages per day will probably exceed the quota of other email services
(maus or commercial services who pay extra for internet email).

We have decided to only talk about one specific topic, and
that all other topics be currently set aside. Proposals for a new
discussion topic should be sent to gem-list-proposal@lexicor.com, with
a reasonable text on discussion and/or justification. The new proposals
will then be queued and as soon as one topic has been discussed and decided
upon, the next proposal will be released.

It is upto the person who has made the proposal to decide when it
is a good time to make the list approve of the proposed standard. Although
we haven't agreed on how this should be decided, I am always looking
forward to new suggestions, so far it might look like that we have to vote
on certain issues.

It is essentially upto the list members to decide on certain
points, and most of us expect that this can be done in a reasonably timely
fashion, in other words it doesn't help if we talk about one issue for
several months, it should only take a few weeks at the most.

Once a certain topic has been agreed the results will be posted
on all services available in an on-line magazine fashion.

Sincerely,

Yat Siu

ps: suggestions, improvements, thoughts please email to
gem-list-admin@lexicor.com. To join email majordomo@world.std.com with the
body subscribe gem-list email.address

One of the good aspects of an announce group is that its index is
rarely longer than one page! This group is not created to produce
more net traffic, but to keep things organized and easily surveyable.

aspect@cats.ucsc.edu (Christopher Taylor Oates) writes:

>You would improve a lot if you simply interted "I think" or "It is my opinion
>that" in front of much of what you say, instead of bandying your ideas as
>facts.

I find this nonsense (IMHO; for who knows a psychologist may prove
that I don't find it nonsense at all). I think that would mean
that I think I'd have to write ``I think'' before every sentence I ever
think I write. I think.

I keep thinking: What's the point of personal communication if people
simply exchange plain facts?

Of course, you may find that this is entirely my opinion. You might
think that. I couldn't possibly comment.

I'd like to know about this too- I downloaded the files, and the overscan program(s) only seem to work with older STs- I have an STE with TOS 2.06.
Anybody got any experience with this?

Hallvard, Oslo, Norway

It sounds like this is due to the bug in the Falcon's VT52 emulation - I can't
remember for certain, but I think the restore cursor position function
does a Home cursor instead. The fix is to use NVDI - its not cheap, but if
you're using a Falcon its worth it anyway, as it'll make your Falcon's screen
display several times faster

4155. Re: Value of BlowUP Hard 1

Newsgroup: comp.sys.atari.st
Date: 1994-06-07 11:11:22 UTC
From: seibert@Informatik.TU-Muenchen.DE
Message-ID: <2t1kkq$5k9@hpsystem1.informatik.tu-muenchen.de>
Source record: 185806

In article <2soqrt$snr@sun.cais.com>, scotty@cais.cais.com (Scott Chilcote) writes:

|> BlowUP calls MS1: it has a horizontal scanning range of 15 to 36 KHz.
This monitor-type showed as being better with Hard II as you can lower the
Pixel-Clock and get a (lower quality) resolution this way.
BUT: You can use it with the Hard I as well. -> Increase the left and right
margins so that the LINEFREQUENCY (kHz) gets into the range useable on
your monitor.

|> BlowUP
|> also refers to MS2 monitors, which have a range of 30 to 50 KHz. I'm starting
|> to believe that since I don't have an MS2 monitor, I'll never get any use
|> from the hardware in this product. If that's the case, I could have easily
|> saved over thirty dollars, and let someone who could use this connector buy
|> it! Why else, in the dozens of preprogrammed configurations, would there be
|> *none* that provide a stable image using the 50 MHz pixel clock?
There are stable resolutions for those multiscans, too.
Select [SVGA]-button. Choose a resolution from the [LOAD CONF]-List, press [OK]
Back in the main-menue you will see if the resulting frequencies match the
abilities of your monitor. BUT: there are monitors that do not syncronize
linarly over the whole range (e.g. NYTECH, SAMSUNG). Then you have to optimize
the margins (be sure to switch to [MS1/2]-Mode first).

|>
|> I note that the documentation recommends using the 16 color modes and below
|> only with the 50 MHz pixel clock, but this has not helped at all.
It's no recommandation it's a restriction of hte Falcon bus-system (It can't
go past 34MHz - in unaccelerated Falcons)

For forther questions please contact me or your distributor.
(UK: System Solutions, U.S.A.: Lexicor, France: Application Systems Paris
Sweden: COPSON Data)

If one Product is not available please ask us too, so that we can correct
it, if it is a fault of the distributor.

4158. Multitasking with GCC

Newsgroup: comp.sys.atari.st
Date: 1994-06-07 11:18:48 UTC
From: kaps3@central.susx.ac.uk
Message-ID: <2t1l2o$cbn@infa.central.susx.ac.uk>
Source record: 185810

I'm sure that some bright spark out there can help with this.

I have GCC v2.5.8 running nicely on my 4Mb STe + HD using GULAM (fine prog that it is) as my CLI. I also use EVEREST editor, the best that i've seen (promise to register today!)

Having installed MTOS on my machine, i thought that it would be nice to have an editor window and a CLI window to program with.

The problem with this is that gulam takes control of the mouse and therefore i am unable to top the editor window without quitting gulam. I've tried a couple of other CLIs but to no avail - either i couldn't get GCC to work properly, or i had the same or similar problem.

I then tried GENEVA - but this being little more than a task switcher, seems to allow the CLIs i've tried to lock the system until i free the TOS window the cli runs in.

I thought that the proble here might be the GNVA_TOSRUN.prg so i tried TOSWIN14 but this needs MiNT.

Anyone any suggestions??

Please don't suggest BASH shell 'cos i ain't got the energy, or disk space, to install it.

Steven (kaps3@central.susx.ac.uk)

|> Hard-I is *NEVER* better than Hard-II ... Hard-II can do ANYTHING Hard-I can
|> do, and MORE.
Hard II always occupies the STE-Port (needed for new controllers)
Hard II (like the other ScreenEnhancers for the F030 connecteed to the
STE-Port) come very close to the ROM-port
-->problems with DONGLES reported by musicians

Hard I gets the joystick (or mouse-port) out from under the F030
Hard I has a TOWER-version (only with a thin cable to +5V)
Hard I is available in the MOUSE-version (+30DM)

So everybody has to decide what's best for him.

|> If you had bought Hard-II, you could choose a pixelclock from 33Mhz and up to
|> 51.5Mhz in 0.6 Mhz steps. (or if it's 0.3Mhz, I don't remember)

The range from 33.5 to 34MHz is the only useable range that gives better
results (on H2 better than H1) --- ONLY for 256col and TC (~5% better
resolution or scanrates).

The range from 34 to 49.9MHz is useful for monitors that don't accept high
linefrequencies (kHz) in low resolutions.
CORRECTION: might be corrected by increasing left and right margin.

50.1 to 51.5MHz showed problems on some F030s -- so it's only sometimes useful.

I believe overscan cannot be used with STEs, only the the older ST(fm)s.
You need to do some soldering to certain areas which are inaccessable on
STEs.

Correct me if I'm wrong !!

They are not really the same thing. I think baud is the number of signal transitions per second, or something like that. I seem to remember you can't get faster than 2400 transitions/s on normal phone lines, and you get higher bps rates by the way that the encoding is done.

That said, most people (including me) use baud and bps interchangably. Only real pedants don't, but there are plenty of those on USENET :) .

It's probably a bit complicated but if you can't find anything else:
- include your GEM image into a TeX file
- print TeX file to disk via dvips
That's it.

Unfortunately you need to know a bit about TeX, so if there is an easier
way, try it first.

ANNOUNCING version 0.24 of the Okami Newsreader (aka O)

```
OOOO
OO  OO  O K A M I
OO  OO
OO  OO  N E W S R E A D E R
OOOO
```

Author: Wolfram R&#65533;sler @ AC2
<wr@bara.oche.de>
Augustastr. 44-46
D-52070 Aachen
Tel. 0241-534596

The program will be available soon on sally.informatik.rwth-aachen.de
/pub/atari/uucp/o_024.zip.

O can be used free from charge by those people who, against all odds,
believe that it is possible for PD software to be excellent, reliable
and bug-free. It is "Snobware", in the sense that people who look down
on free sofware and are too haughty to believe that it can be
excellent, reliable, etc., but still want to use O (because it is
excellent, reliable, etc.), will have to pay their dues in the form of
a contribution to a Human or Animal Rights organisation, or any public
charity institution.

O has the following features:

- multi-window user interface
- up to 256 windows (if the operating system can handle them)
- newsgroup folds - file browser
- semi-automatic PGP interface
- regular expression or string search
- built-in uuencode, uudecode, btoa, atob
- multi-volume message to file save
- built-in metric conversions
- thread walking
- pseudo newsgroup for outgoing messages (Outbound)
- pseudo newsgroups for mail and mail-archive
- built-in Mausnet support
- user-definable command-oriented keyboard layout
- configurable on-screen text effects
- configurable on-screen TEX conversion
- command shell interface
- user-definable quoting style
- cancel-message generation

- super smart signature system
- Hall of Fame (read all about it in the docs how to get in there!)

For those who can: please forward this message to comp.sys.atari.announce

It is unreliable - development of it stopped before even Big GEM (BGM)
partitions were invented!!

Try the 'zorg' program instead, it is new and I haven't tried it (I
use Minixfs anyway). It is also at a.a (AFAIK).

The official UK price is 129.95 GBP, but it isn't quite available yet
from Hisoft. There is only one version (one size fits all), which is
Papyrus Gold. It runs on the Falcon fine. It runs on the TT better :-)

Anyone use this multitasking software???

Know of any alternatives to the supplied GNVA_TOSRUN program that agrees
with TCSH shell, or okammi shell since i get some bombs.

TOSWIN14 doesn't work - it needs MiNT

Umm. i have used Calamus 1.09N (of course b/w) and some of the Pagesterams
earlier versions. And what I must say is that Calamus (even that earlier
verion) is enough innovative and easy to use for a that kind of work.

Though SL version is good enough for a pro DTP work. Pagestestream is not.

In regards to black and white I don't think you need SL, 1.09 was made for
B/W systems *grin*, however in regards to you comment about pro DTP work
you might find some disagreement, I think Pagestream is professional enough,
and actually should be compared more to 1.09, I am unaware of the price
differences though...

DA's Complete DTP system should be compared with SL IMHO

Cheers

4175. Modems and Comms programs

Newsgroup: comp.sys.atari.st
Date: 1994-06-07 16:01:59 UTC
From: djs@jet.uk
Message-ID: <1994Jun7.160159.26538@jet.uk>
Source record: 185832

Time for me to get home machine connected up: Novatech are offering Sportster 14.4 fax modems at 129 GBP. This sounds like a good deal, anyone got any comments on the suitability of this modem? (The Fax facilities aren't particularly important to me, but that sounds like a good price for a fast-ish data modem).

Which is the best Falcon-compatible comms s/w (terminal emulator, file transfer etc)? I'm be getting onto CiX if that makes any difference!
A freebie is preferred, but I'll buy the s/w if necessary.

Thanks in advance for any advice...

> Please e-mail me if you know of anything like this

You can do it with Pagestream simply by importing an IMG and printing
Postscript to disk.

I am pretty sure there is an img2ps out there somewhere, but this is all
that is on the atari.archive.umich.edu archive:

degas2ps.arc 65 Degas to post script converter.
1stw2ps.arc 53 First word to post script convertor
gem2ps.arc 80 Gem => post script (and back I'd bet)
mfps.arc 80 Metafile -> postscript converter (sameas gem2ps)

Hope that helps.

Correct me if I'm wrong but couldn't a DTP package be used instead of LaTex?
I'm sure Fleet Street Publisher can do this, so I'd think most others can.
Alternatively you could convert the IMG file to a graphics format readable
on the UNIX/dos machines and then convert it to a postscript from there.

Gemview can convert IMG files to many different formats readable on XV for
UNIX. XV can output Postscript files so there's one way. Maybe even the
registered version of Gemview can save Postscript?

Just some ideas...

From what I understand, it is correct that Overscan can not be used on STE's. I have is installed on a Mega ST, though, and it works quite nicely. It is a fairly simple modification, and allows a noticibly larger screen image on a standard mono monitor. I think that a multisync can provide an even larger screen.

You're not!
There is a mailing list for Notator, Logic and other Emagic programs.
Send mail to majordomo@mcc.ac.uk with the body text
subscribe logic-users

There are something like 60+ people here.

I maintain the Notator / Logic web page if you have web access, the
address is
http://web.city.ac.uk/~cb170/notator.page.html

There is screenshots, features listings, press releases and all the
digests of the mailing list there.

Fokke de Boer, who runs the mailing list has set up file areas for
notator, but currently they are fairly empty, but that should improve in
time (there are several things that I will be putting there shortly).

Welcome aboard!

ST Tools failed to work for me, I kept getting 2 bombs. I know that it's not
freeware, but Diamond Edge really is unbeatable, I think.

>Note: you must do a clean up of your hard drive befor you try and optimize
>your hard disk or you can end up loosing some files...

>I only use ICD's CleanUp for this....
I had problems with files created by cleanup.prg that couldn't be
deleted. Diamond Edge sorted them out for me. 50 quid might sound
like a lot of money, but if you value your data...

Diamond Back 3 is a different story, though; it doesn't like my tape
drive at all.

It doesn't like any of the Falcon colour modes, so you would have to keep switching back to mono to run Calligrapher. You could consider Atari Works or Papyrus as alternatives, depending on your needs.

In the UK, HiSoft did a good deal on Atari Works (50 quid for Falcon owners). In some other countries Atari Works comes free with the Falcon.

So you got a "Multi TOS boot disk" for no-HD falcons, surprise! That's
what you bought, isn't it?

You have to copy the files to C:\, throw FAKEFLOP.PRG out of your AUTO
folder, modify GEM.CNF and MINT.CNF (in the MULTITOS folder) to reference
C: instead of A: (use any ASCII file editor) and that's it.

bye, Peter

>I admit).

Nope, in the context of modems baud is not always equal to bits per second. Baud means the number of signalling frequency changes per second; in modems faster than 2400 bps there's more than 1 bit per baud. E.g., in a 9600 bps V.32 modem, the signal rate is 2400 baud, but there are 4 bits per baud. The basic frequencies used are the same as for 2400 bps modems, but instead of just encoding/detecting the presence of the high and low frequencies, the phase of the wave in each time slice is also used. This is some pretty hefty stuff to deal with, which is why high-speed modems only got cheaper after fast DSP got cheap. This is probably also why the NeXT guys only worked up a 2400 bps DSP modem, was probably too hard to reliably decode the phase info for the higher data rates with a 25 MHz 56001.

On a slightly related topic, has anyone else noticed a problem with the MFP_TT driver in the HSMODA package? It seems that setting the port to 19200 in Connect still gives me only 9600 when MFP_TT is loaded.

Yes, but not significantly larger. I never did get a full 480 lines
on my multisync. Still, 800+ pixels horizontally was pretty nice.

My brother has just gotten a dial-up account on the net and is using Falcon with STalker to log on with. I told him to use a VT100 emulation, but he only gets control characters instead of inverse characters (etc.). What are you other ST users using to log onto your accounts with?

Thanks for any suggestions.

Hmm, I dunno. Does TCShell need MiNT loaded perhaps? (just wondering).
If they make Geneva MiNT-compatible like they said they would do,
then TOSWIN may become a possibility again...

Could you explain to me what you're doing with this texture mapping and how it works? How are you storing the original bitmap, and how is it being accessed and mapped to the screen? How do you deal with other adjacent bitmaps? When updating the screen, do you draw the whole screen from top down or do you draw each of the irregular polygons individually?

Personally, I would say CoNnect would be the best overall. There's also
STalker, FLash, and various other ones. STalker and Flash are
commercial (Flash 2 is shareware i think); CoNnect and various other
comms (pd/shareware) can be found at atari.archive.umich.edu in the
atari/Telecomm directory, and at other fine FTO sites :-)

I would lean towards CoNnect or Stalker, since you're on a Falcon,
and probably would want to run it in a cool resolution (i.e.,
640x480x256, etc). With either, ya might want to have Warp9 or
NVDI as well for good speed updates...

There might be a CiX "front end" (like GEnie's Aladdin) but I'm
not sure offhand...

I'm using GCC 2.3.3, MTOS, TOSWIN, EMACS and ksh (korn shell). All versions
from a.a.u.e or mirrors (except for MTOS of course - MiNT 1.10/AES4.00).

Took me a long time to configure - especially to get hold of all the
utilities that come standard with Gulam (which I used to use), but it works
wonderfully.

well i'll add some more info about the problem with ttyname. i'm trying to build scm v4e1 (a scheme implementation). it has portable sources, including a makefile for the atari st, but the ttyname() is not handled properly with #IFDEFs.

here is the block of code it's from.. I haven't had time to sift through the code to see what is going on, but i'll do that when i do get time.

```
void prinport(exp,port,type)
SCM exp; SCM port; char *type;
{
lputs("#<",port);
if (RDNG & CAR(exp)) lputs("input-",port);
if (WRTNG & CAR(exp)) lputs("output-",port);
lputs(type,port);
lputc(' ',port);
if CLOSEDP(exp) lputs("closed",port);
#ifndef MSDOS
# ifndef __EMX__
# ifndef _DCC
# ifndef AMIGA
# ifndef THINK_C
else if (tc16_fport==TYP16(exp) && isatty(fileno(STREAM(exp))))
lputs(ttyname(fileno(STREAM(exp))),port);
# endif
# endif
# endif
# endif
#endif
else if FPORTP(exp) intprint((long)fileno(STREAM(exp)),10,port);
else intprint(CDR(exp),16,port);
lputc('>',port);
}
```

Well, the latest TV my family got has a selection on the remote for 60-PAL, which is meant for "connecting to videos with the ability to display NTSC tapes on a PAL TV." So if you're trying to get an appliance salesman to understand what you're on about if you want to buy a TV, try something like this.

(Ours is a Mitsubishi, btw.)

Rhetorical question: Why can't they just have external v-hold knobs? >:-(

>I thought that the proble here might be the GNVA_TOSRUN.prg so i tried
>TOSWIN14 but this needs MiNT.

If you have MTOS installed on your machine, then you are already running MiNT.
And, the MTOS package should have included MiniWin, which is a stripped down
version of TOSWIN. As such, you could use any .TOS or .TTP program and run it
in its own window. If you don't like bash, there's still several other shells
out there.

Unfortunately, if you're already used to gulam, it will take some work to get
used to all the direct-from-unix shell ports. Main thing being, gulam had a
zillion built-in commands so that you had everything you needed to do productive
work all at your fingertips. Using any of the other shells, you'll also need to
grab appropriate fileutils archives etc. to give you basic commands like ls,
cat, cp, etc. I use tcsh 6.04 almost all the time; when I'm concerned about
memory usage I use ash. (Of course, since I recently added 16 MB RAM to my TT,
I haven't had to resort to using ash for quite a long time now...)

Connect, by Wolfgang Wander, is definitely the best around. It's not quite fully supported on the Falcon, but it works, and will let you run the serial ports at very high speeds.

On the TT, Connect lets you use any of the 4 serial ports, as well as the MIDI port. On the Falcon, it only lets you use the modem port, but not the LAN port. Seems to be an oversight, but I haven't seen this fixed yet. (Last version I used was 2.40.)

Connect is shareware; you can use it for something like 30 days before you must register it. I think it's well worth it.

There is a program around that loads into memory, so that when you print
from an application (eg Calamus), it goes to a buffer that can then be
saved as a postcript file. I've got it somewhere, but I haven't used it
yet so I'll have to check it out.

You can't perform the overscan mod on an STe. The video hardware has been
combined into a single chip, and the required signals don't come out of the
chip. You can only do the mod on an older ST because those are the only systems
where the video sync signals appear at accessible points.

Here's the scoop: While working in GFA 2.0, I went to save a file.
However, when the directory listing came up, I accidentally clicked
on the wrong file name to save it under, and saved it as GFA_BCOMM.PRG,
the compiler for GFA!

Now, I haven't touched the disk since then except to rename my program to
something else. This I did from the actuall desktop and the Show Info box,
so it shouldn't have altered any space.

I immediately got the RECOVER.TTP program from the archive, and tried to
recover it. I found what's looks like it (right text appeared in the
cluster), and collected the clusters and saved it to a new disk. Now I
tried running the recovered clusters/program and keep getting
TOS Error #35.

Here are my questions:

1) What does TOS Error #35 stand for?

2) When I accidentaly clicked on the wrong name (GFA_BCOMM.PRG) and it
saved my program under that name, did it write over part of the actuall
compiler, or did it just change the directory heading info at the beginning
of the disk? Hence, is recovery completely impossible now?

3) When looking it over, I assumed that the programs were seperated by blank
disk space, and that the null characters are shown as ^F's. If this is
wrong, and they are listed as something else (in RECOVER.TTP), then what?

4) If it's impossilbe for me to recover, than what next? Since GFA has been
updated so many times (3.* now) and this is such an old old version (I think
later one's were even public domain), how would I go about finding a new
copy? Mine was the first version of the complier to come out.

Thanks!!!!!!

I got the file CENTEPED.LZH from the archive, got everything ok, ran the file extracted (CENTI.PRG). Sound was incredible, got the beginning Sinistar credits. As soon as it hit the color "Select Language" screen, the v-hold went. Anotherwords, it started rapidly scrolling vertically. I have a 520ST (one of the originals from 1986, first one with TOS installed in rom). Is it by chance expecting the blitter chip or something? Or possibly some other graphics co-processor installed on later models?

Thanks!

Cross-posted to: alt.atari.2600,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

Thankyou you very much for taking the time to read this.

Hi, I am interested in starting a list of Atari programming information sources. This list will include information on books, magazines, fanzines, technical documents, Special Interest Group newsletters, on-line tutorials, ftp sites, Email mailing lists, telnet services, and anything else dealing with programming on the Atari. I'm looking for sources of programming on anything from programming GEM to programming the MIDI port to programming the DSP in the Falcon and even programming on the Atari 800 if available. I also wish to make a comprehensive listing of hopefully all magazines published to date that deal with Atari, even if the magazine is not published anymore, but if back issues are still available I'd like to hear about it. Also if you use the Atari to program alot, I would like to know about books,etc. that you find useful in your programming, even if they aren't written for the Atari. I would like to get contributions that contain info on any Atari from the Atari 400 to the Jaguar to the MEDUSA040. Basically this list will include any and everything (hopefully) ever written about the Atari (tech stuff on the Atari 2600 will also be gladly taken). Please read below on how to make submissions.

My reason for starting this list is simple I have owned an Atari 130XE for over 9 years now and want to move up to a Falcon or beyond. I've been searching for sources of programming on the bigger and smaller Ataris for awhile now and have found hardly nothing. And no one I know of locally has even heard of the Atari so I'm hoping this list will help people, like myself, who have not been very successful in finding information sources for the Atari. I plan to put all the info I receive on all major Atari ftp sites, newsgroups and any mailing list(s) around, and will keep it updated to the best of my ability. Below is sort of an outline of how I would like submissions to be sent. Thanks again for all your help and I will do my best to make this list the best.

Submission Info::
For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,

i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.

Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

P.S. Sorry for all grammar mistakes and spellings errors and also
for the long post. (It's about 2 in the morn here)

From: bjr2@Ra.MsState.Edu
Message-ID: <2t3rof$2er@Tut.MsState.Edu>
Source record: 185776

Is it just me or are the CPU cases for ST,STE,TT,FALCON computers really cheezy!?! Well, I'm looking for a solution to this problem. Idealy, I would like to find a 19" rack mountable CPU case for my 1040STE. Does anyone know of a place that will slap one of these together for a resonable price?
If you or someone you know is handy at building chasis units and such, please drop me a line. It would be nice to get rid of some of these wires that hog up my desk space, and even better is I could pop everything in a flight case and be gig ready at the snap of a few latches.

Brian

4232. Sequencer help!

Newsgroup: comp.sys.atari.st
Date: 1994-06-08 08:03:42 UTC
From: pgl@draco.bison.mb.ca
Message-ID: <1994Jun8.080342.8802@draco.bison.mb.ca>
Source record: 185616

I'm thinking of picking up a used 1040 ST and mono monitor to use for sequencing. I'm not sure which sequencer would be best suited for me. I need something that'll give me the biggest bang for the buck (who doesn't?). I don't really need to edit and print standard notation, but I do want something with a lot of editing options and programming power. Speed is an asset, and if it can run alright under 1 meg, that'd be handy too.

I can't seem to find much information on them, so if anyone could fill me in, I'd appreciate it. What's the difference between Cubase, Cubase Lite, and Cubeat? Everyone seems to be on the Cubase bandwagon, is it really worth the price? Or is there something else cheaper and close to it's power? I've seen ads for Breakthru by Gadjits, C-Lab's Creator, and Dr. T's KCS they seem pretty good. But that doesn't give me any indication of how good they are from a users perspective. In other words, I'm looking for personal experinces with Atari sequencers, pros and cons.

Please reply be e-mail. Thanks in advance.

4233. Wolfram Roesler author of Okami Newsreader

Connect, by Wolfgang Wander, is definitely the best around. It's not quite fully supported on the Falcon, but it works, and will let you run the serial ports at very high speeds.

On the TT, Connect lets you use any of the 4 serial ports, as well as the MIDI port. On the Falcon, it only lets you use the modem port, but not the LAN port. Seems to be an oversight, but I haven't seen this fixed yet. (Last version I used was 2.40.)

Thanks for your kind review. However Connect 2.46 supports (together with an installed HSMODA02/04) any port HSMODA offers. One of this ports is the LAN Port on the Falcon...

hi,

yesterday I downloaded the game OXYD. Altough the game looks very
nice, i haven't got a clue how to play it. In landscape #1 something
drops on my black ball immediately and i can't do a thing. I have
succeeded in moving the ball a bit around the screen but the controls
are so terrible that i end up crashing to walls (resulting in death).
The use of the mouse is so awkward that i thought that maybe I do
something wrong here. The game is a bit weird about sounds: sometimes
i run it and every keystroke results in a kind of barking sounds, sometimes
i have no sound at all.
The game left a bit frustrated last night, so i would appreciate some
'help' on this game.

bye

It's not that clear-cut. Some people would suggest that the other way
around is true, given that PageStream has full support for the
industry-standard PDL (ie PostScript), but Calamus SL (even with Bridge
Module) does not.

Unless, of course, my understanding of the Bridge Module is wrong; does it
allow EPS import, use of PostScript fonts, ... ?

Source record: 185799

OK, this has probably been covered in some parts over the
last few months but could someone please give me fuller
details as to how to get on-line.

What I want is access to my university UNIX account, so
that means I want access to Telnet and FTP.

I'd also be interested in getting access to this newsgroup
and possibly having a seperate e-mail account.

I know that Cix can do most of these but how expensive
is it? Where does one contact to get an account with them.
What are the charges like?

What would be the best modem to buy? I'm not fussed about
sending/receiving FAXs so a basic modem would do.

Anyway hope you get the message. Could someone send me
full details? Is there a text file on this subject
available - I think it would be handy.

Cheers,

Barry

Didn't the ancient Music Studio (or something like that) not
create .SNG files? I remember seeing this program included with
an older STE pack and there was loads of plinky-plonky chip music
on the disk in SNG format.

Message-ID: <2t4961$d6b@infa.central.susx.ac.uk>
Source record: 185793

For all you users out thers that want a relaible and foolproff Ramdisk, check out TCache60/61 or 62.

I use TCache60 purely because i couldn't see the benefit of using either of the latest versions.

The program also has numerous other functions like caching and for all those that can (my STe just can't quite manage..) virtual memory is handled.

An auto program is configured either through an .ACC or CPX and low and behold, booting up installs the drive(s).

It's certainly the best that i've found.

You can find it at good ol' UMICH.EDU or mirrors.

Happy ramming.

AFAIK there are two versions of pap (at least in Germany). The standard version and the GOLD version. The standard version does not have the extended features of the GOLD version (the DTP and office features).

I've downloaded all the available versions of MacMiNT, there are three of them. The biggest one with all the gcc
and g++ staff installed is from suniams1.statistik-tu.de or something, the main program is larger in bites and
support copy-paste, with online 'man' support, but I find it extremely unstable -- sometimes the mkdir, or rm or any-
thing that will have to create/delete files/dir's will cause trouble, 'permisson denied' is typical. With my case, simply
type 'cd' may solve the problems temperorily.

one of the other two is called jet, with which you get several scripts for optional installation of shells, you may need
to get some binary files directly from mint atari.

The last one is the one I am mostly using, all the stuff is within a directory named mint-0. This one doesn't support
copy-paste or man command as are found with the one I mentioned firstly. But it's definitely stable, and is definitely
useful if you install the GNU stuff, and the installation may be not tha difficult.

I'd like to hear any commends you got.

Chuck

PS. I find MacMiNT's multitasking feature isn't that great even with a Mac with 8 Mb physical RAM, and is incompatible
with any sort of VM.

djs@jet.uk (David Stevenson) writes:

>Unless, of course, my understanding of the Bridge Module is wrong; does it
>allow EPS import, use of PostScript fonts, ... ?

Bridge Module
DMC is very pleased to announce Bridge - the long-awaited upgrade of
Dataformer. Bridge is a single module with 4 command groups. The first
command group contains all the functions for converting frames or page to
a number of raster and vector graphic formats. These include (raster
graphic) Degas, PIC, NEO, PAC, IMG, ESM, BLK, PCX, IFF, TIF, TGA, CRG and
GIF (87a) and (vector graphic) CVG 1.0 or 1.1, GEM, DXF, PLT, EPS, PS, and
Illustrator EPS.

The second command group in Bridge is a much improved set of
PostScript functions which include the ability to compress graphics, text,
show pages, do multipage, print to serial/parallel/file, etc. TIFF header
file options are also available.

The third command group converts raster graphics among different
numbers of planes and colour depths. This command group comprises a very
powerful set of functions which even allow the conversion of RGB graphics
to 4-colour CMYK. You will be impressed with this command group.

The fourth command group converts frames to vector graphics, useful
for creating special effects using Outline Art, the Vector Graphic or Line
Art modules. Special skews and masking effects can be created when frames
have been vectorized using this command group.

Calamus can already use type 1 fonts as there are a number of programs
around that can convert .pfb 's to .cfn 's.

If you have a UNIX account with a UNI, ask and see if you can get access with them. Our university has a special number you can call to log into the computer system. You then only have to pay telephone charges.

Why things like CIX cost is they are essentially providing you with an account - if you already have a uni one, then use that if you can.

The thing is, I downloaded 2 arc'ed files,
22415 Oct 30 1992 sngfile2.arc
80768 Oct 30 1992 sngfiles.arc
from "atari.archive.umich.edu/<not sure>/atari/Music",
and don't have anything to play them on.
I was therefore wondering if there was a player
actually in the same directory, but there seems to be about
50+ programs in there, and I cant afford to download them all
and check each one! Is there a player which is actually PD, and
available from ftp? (I particularly wanted to hear some TOM LEHRER
songs which were archived as lehrer.arc, and had the .SNG suffix too).

Thanks once again for all who've already answered,

Adam

Can you run 50Hz stuff without vertical flipping? If you are not sure, that is probably the problem. Many games sync the monitor at 50Hz (as opposed to the regular US 60Hz) for a number of reasons (freeing up more of the CPU, for one). For most SC1224 monitors, you can adjust the vertical hold once and it will work in both 50Hz and 60Hz mode. To test this theory, I suggest you grab one of the 50Hz booter programs on atari.archive.umich.edu, and see if your display starts to roll when you switch to 50Hz.

A 50Hz boot is designed to allow folks with US machines to run software that assumes that a 50Hz sync is the default. It simply switches the display to 50Hz, and allows you to boot or run stuff while in that mode. Most software detects and switches the sync rate automatically.

Centipede is quite nice. I suggest you check out Cybernetix as well.

: Not a great deal of recent software will run on TOS 1.0 or 1.2. This
: is due to problems trying to code around OS oddities, most of which
: is fixed with the major re-write of TOS 1.4!

This is not true. I have always had TOS 1.2 and on the whole, only
software which is Falcon or STe specific will fail to run on it. I don't
think upgrading to TOS 1.4 would do anything for me, except to stop me
needing FATSPEED.

If anyone can, post a list of any software you know of which will not run
on TOS 1.2 but will run on TOS 1.4. I will be very interested to see it.

One of the modules (I forget which) allows one to export just about anything
in Calamus to a myriad of image formats, including PS and EPS. And
considering how cheep and icky PS fonts are, it's a good thing that Calamus
just produces a big vector file with no fonts in it, per se.

I'm not familiar with STalker (using it anyways) so I dunno if there
are any special settings he might need to use...

Personally, I use CoNnect, which does *very good* VT100 (and misc
other VT's). An oldie but goodie that's also excellent for VT
emulation is Uniterm 2.0e. Both CoNnect (filename is probably
like conn246.lzh) and Uniterm are available at FTP site
atari.archive.umich.edu in the atari/Telecomm directory, and
other fine FTP sites...

CoNnect should work in any Falcon mode. Uniterm (if it does
work, I assume it does) probably only works in the ST-compatible
modes (640x200x4 and 640x400x2), i.e. ST Medium and Hi...

Sorry about that Paul, The note I jsut sent before this one about needing the Bridge Module is for Calamus SL, if you know of someone who has SL, they can load your 1.09 .cdk file and convert it to PostScript if they have the Bridge module, conversely you can call Calamus' Service Bureau and I'm sure they can do it.

G'day all.

A few days back I posted an article about how I was looking for alternatives to the Mercury UUCP package. Thanks to everybody who replied via Email! Almost to a person, they all pointed me to the 'Upoint' package. I went and did an archie for it but came up skunked! Can somebody please tell me what the filename, or even better, the filename and I site where this package is ftp'able? A thousand thanks in advance!

Does anyone know of a offline reader for atari (TT) that supports the SOUP or ZIPMAIL format (used on some dial-up internet connections running on UNIX machines).

The DOS equivalent is YARN, and a source (in (ANSI) C or G++) of YARN or compatible might also please me.

Also a decent QWK reader might do temporarly, but QWK have limitations on how it handles internet news and mail. I've tried Captains QWK reader and microTALK QWK reader, but both have serious problems running on a TT in TT-High, and I don't want to switch monitor to read news/mail!

It's _not_ PD though. It costs 20DM for the registered version (28DM for the English version, but I got mine for 20DM). The demo version (which will take you some time to complete...) was on the Atari ST User coverdisk a month or so ago...

It is also available for Freqing from a number of UK BBSs (the Tavern and Fortress have it). The unpacked un"crack"ed German-text version is also available on those BBSs.

Here's some blurb on the game itself....

From: alrashi@ecf.toronto.edu
Message-ID: <Cr3nB2.ADB@ecf.toronto.edu>
Source record: 185633
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The subject more or less says it...
I'm looking for any ethernet card (and the software of course!) that can
connect my TT up to a Mac ethernet network...
Is there such a product? Is it even possible?!

Why I want it:
I need to send Calamus files to a Fiery Xerox 5775 colour laser copier,
which is hooked up to a Mac network. Since I can't directly send my
Calamus files to the Fiery (Can I? If anyone has any info in a possible
driver for Calamus, or anything, please respond!!!) I want to send them
to a Mac in Tiff format, so I can convert and send to the Fiery. Problem
is, I can't use the serial port on the TT because it's too slow (some of
my files are 40megs and up) so Ethernet is my only solution.

Also, does anyone know if DMC Germany has an email address? I'd like to ask
them if Calamus has any drivers to directly send to the Fiery Xerox 5775.

If anyone can help me out on this, I'd be eternally in their debt!!
Many TIA!

4291. TT Hard drive problem!! (Help!!)

Newsgroup: comp.sys.atari.st
Date: 1994-06-08 22:33:14 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <Cr3nzF.B4r@ecf.toronto.edu>
Source record: 185645

Like the subject says, I'm in dire need of help concerning the health of
my hard drive!!
Okay..some info first:
The drive is a Quantum Pro-drive ELS, SCSI-1, 80 meg harddrive.
The drive is partitioned with BGM partitions.

The problem started a while back when a friend of mine was trying to save
onto the drive and got a "Output device not receiving file" message.
He tried to fix it using Diamond Edge, but inadvertently he _might_ have
deleted out the entire partition. Whatever it is, no files show up in the
partition anymore...leading me to believe that the FAT is probably screwed up.
Now, nothing can even read the partition!! And yes, I tried fixing it with
Diamond Edge, but it couldn't access the drive.

My problem:
How in the heck do I fix this??!? I ported the drive over to my Pc-compatible
(which happens to have a really nice auto-config scsi card) and _did_
manage to find out that data still exists on the drive... I need to know how
to get it!! Incredibly valuable data files exist on the drive!! (argh!)
Anybody out there have any ideas? Can any software (ala Norton Utilities) out
there solve this problem? Is there anything I could use on the Pc-compatible
platform that could _understand_ BGM partitions and fix this problem?

If anyone has _any_ suggestions, please respond _please_!
Manymanymany TIA.

There are some German Ethernet cards for TTs. I know they are quite expensive, but they do (or did) exist. I seem to remember a price tag approaching $1000 (this could be totally bogus, like I'm remembering it in D-marks or something, though with today's rates...). Also, there would still be the problem of talking to the printer using the EtherTalk protocol.

Actually, there is at least one other nice solution. You would need:

1 or 2 Syquest drives
Spectre 128/GCR, or perhaps the program MacSee, or perhaps Dos Mounter :-)

Ok, Syquest drives are removable platter hard disks. There are 5.25" drives (44mb, 88mb, possibly larger) and 3.5" drives (105mb, 270mb). Access speed is quite fast (feels like a fixed hard disk). With your TT, you could probably just plug a single drive into it, transfer your file (see below), unplug the drive, stick it on a Mac, and print directly from the Syquest. With two drives, you just carry the cartridge over to the Mac unit and print away. This would be significantly faster than downloading 40mb over a 10mbit/sec Ethernet (even if you had to hike a bit to get to the printer).

One way to write an ST file to a Mac filesystem (on a Syquest) is to use the Spectre 128 or Spectre GCR Mac emulator. All you would really need is the Transverter program, which is included with the above (and might be available separately, or even PD). You would not have to actually emulate a Mac to do this (though you would have to use an old-style MFS filesystem, no big deal for transfers). If you actually emulate a Mac, you would still use Transverter, but could write the file to an HFS partition (which is the normal Mac partition type nowadays). Another way is to use the program MacSee, which I believe allows you to read/write directly to a Mac HFS filesystem while in native ST/TT mode. An early version of this program, called MacRead, is

available from atari.archive.umich.edu (and some info about MacSee is included, I think).

MacSee should be available from Toad Computers, and other places. I don't have direct experience with the product. I do use a Spectre GCR a fair amount on my MegaSTE, and it works very well indeed. Version 3.1 of the software is supposed to be coming soon, which should greatly improve TT support (I think it will work with 3.0, but some desireable features are unavailable).

Yet another possibility would be to use Dos Mounter or other PC mounting utility on a Mac, and write to the Syquest cartridge in native ST mode, depending upon it being a PC compatible format. I think the ICD software formats Syquest cartridges in a PC compatible way. I cannot verify this, but perhaps someone else on the net could. A call to ICD would probably clear it up.

Now, the bare drive for a 44mb Syquest costs about $290 or so, an external Mac unit about $320. For the 105mb 3.5" unit, the bare drive is around $460, an external close to $500. The cartridges for both of these cost the same: ~$60 (all prices in US dollars, recent guestimates)! So, if the TT Ethernet stuff is as expensive as I remember it to be, you could probably get some nifty removable platter drives for about the same price, with much more general utility. The addition of an external ICD Link host adaptor would add another $100, though I suspect you could just plug it directly into the SCSI port on a TT.

I personally own two 44mb drives, and they are great! I have one at home, one at work. I can bring home stuff in 44mb chunks, and keep ongoing Mac work on the cartridge. There are drivers available for PC, Mac, Amiga, Suns, etc. The 105mb drives are even nicer. They spin up significantly faster (about 5-8 seconds, verses ~15 for the 44mb units), read/write faster (the 44mb units go at around 28ms), and the cartridges are quite small (about the size of three 3.5" floppies stacked together). Any Mac peripheral catalog will have these units (they are very popular in the Mac world, not so much in the PC, which is just recently getting reasonable SCSI). Also, Computer Shopper would be a good source.

Lots of folks are upgrading to the 105mb units, so the 44mb ones should not be hard to find on the used market. I bought both of mine, and all my cartridges used, and have not had a problem.

Hope that helps, feel free to email questions.

>scroll with any decent speed.

Agreed, *UNLESS* you have Warp9 or NVDI loaded in. It's a tradeoff
of screen updates vs compatibility - Uniterm for instance is a killer
VT term, but you can't run it in 640x480x256, for instance (at least
I don't think you can) - ditto with Flash - though both do have
quicker screen updates than CoNnect or STalker. However, you should
be able to run CoNnect or STalker in any resolution (I had CoNnect running
in ST LOW MonSTEred, i.e. 640x400x16, and it worked - not the best
environment, but it worked) - this is why I would recommend one of those
two for use *on a Falcon in particular*. Really, with ANY GEM-based
program, you ("you" in general for anyone) should use Warp9 or
NVDI - even when using the plain old desktop - it makes a significant
difference...

>Hey, Anisko! We're waiting on your article!

::shrug:: I'll try to speed it along - I don't want to turn anything in
that doesn't pass at least my personal standards... will get it to GEnie
in a couple days hopefully...

2 to 1.4 and was thought it was worth the money.
For one thing you can move files from TOS and there are other benefits
making it a better version of TOS. Sometimes you can pickup a used
set of chips for 25-30 bucks and they are easy to install.

4296. Zork problem

I recently bought a copy of Zork, was thrilled for a while, explored every thing I could find, and got stuck. I'm not looking for spoilers, but I have found instructions in a boat that say to launch it with "launch boat". When I try that, I'm told "You can't launch that with the word `Launch'." Could some kind sould tell me wether this is a puzzle or a bug?

Thanks,
~Adam

I'd have to put my vote in for STorm 1.2 as the best comm's
package. It's small relative to Connect (~500K vs ~750K -- dunno about
STalker) and very full-featured. No cryptic script language to fool with
-- macro programming is done in a built-in BASIC.
Unless you need all kinds of strange features (IMHO) like an Answering
Machine (et al) built in (a la Connect) try Storm. Heck, try 'em both if
you can! :)
Feel free to write if you want -- I've tried them both.

Great Atari ST games & stuff for sale!

GAMES:
For $5/each game:
Arena, Deep Space, Barbarian, Obliterator, Terrorpods,
Mr. Heli, Forgotten Worlds.

For $15/game
Wrath of the Demon, Awesome, Wanderer 3-D.

Compilations:
"World Beaters"--Outrun, Gauntlet II, 1943, Street Fighter-- $20
"Sega Master Mix"--Super Wonder Boy, Turbo Outrun,
Crack Down, ThunderBlade, Dynamite Dux---------- $20
"Triad II"--Menace, Tetris, Baal---------- $15
"Triad III"--Speedball, Blood Money, Rocket Ranger---------- $15

EMULATORS:
Spectre GCR (MacROMS includes) v.3 ----------$199

FLOPPY DRIVE:
Future Systems' double density GTS-100 3.5" drive with LED
track indicator----------$90

MISCELLANEOUS ST STUFFS:
Mega ST keyboard ----------$15
Atari Mouse----------$20
OMNISWITCH (connects the ST/STE to any Multi-sync monitor)---$20
ULTIMATE RIPPER: this cart lets U break into any program,
disassemble, freeze any screen pix, etc! U'll love it!-------$40

BACK-UP your copy protected games with:
TURBO BLITZ (software & cable)----------$15
SYNCHRO EXPRESS (software, parallel port cart & cable)-------$30

buyer pays shipping

It was none other than -Unknown- that wrote on 30 May 94 that ,

-> I have an STe with 4Mb RAM, TOS 1.62 and an 80Mb hard disk. I am
-> considering purchasing Mag!X to replace the OS. I have read that
-> single tasking it will run
-> faster than standard TOS. Is this correct?

yes and no less impressive running a host of program's aswell. For anyone with an early TOS it's a must have even just for the optimisation of TOS with a fix for the serial port , Faster VDI (still better with NVDI though) , vastly optimised Disk I/O .

-> How does Mag!X run GEM programs which do not use a window? Does it
-> place its own window around the display?

You mean TOS program's ,GEM program's all use Windows. The answer is yes it has a driver to direct TOS,TTP program's into there own window . Or I think you can alter the config to use another suitable driver .Anyone tried TOSWIN (The new version) with this ??

-> Does Mag!X replace the standard file selector?

It replaces everything but the file selctor is dependent on the desktop you use (or indeed a replacement FS) ,the supplied one is not that brilliant (still better than pre newdesk though!) but GeminiV2 is better and Ease or neodesk4 promises to set your ST alight !

-> Can you quit from Mag!X like Terradesk?

Not without rebooting since it is not just a shell like Terra but a complete OS rewrite. BTW terra doesn't support the neccessary GEM protocols to make it useable with MAg!X

-> Are there any other incompatibility problems with the system other
-> than the music package identified in ST Review magazine?

There are a some program's that point blank don't run (not many) and they are the usual thing's that even have problem's with different TOS's !
Some program's don't behave correctly but work alright. Common problem is program's not updating the screen when quit ...lucky there is a hand TIDY UP option in the MagX menu popup which normally sort's thing's out.

Some program's like to hog all the free mem but there are way's round that aswell (a supplied util).

Well behaved GEM and TOS program's have no problem with MAg!X and I haven't found any reason's not to load it in defacto standard yet ,except for games playing that is ....but even there it is not a complete lost cause

!!!

-> Any other information would be greatly appreciated.

It really need's a better desktop but apart from that I'd say along with
NVDI it thee an essential purchase for anyone with an ST.

> From: Lonnie McClure <lmcclure@delphi.com>

> Hmmm...I thought I rememberd something about CMOS chips consuming more
> power if inputs were left floating. I assumed since I had not heard of

You are correct. CMOS consumes power when it changes state, or when it is in the region between about 1v and about 2.5v, where it is operating in a roughly linear mode. In actual practice, most modern CMOS incorporates an internal pullup on the input lines to properly bias the input drivers, so this becomes more of a paranoia issue than anything else. If you are dealing with old CD4000 series stuff it is usually a good idea, and it is generally good engineering regardless of what you are using, but it is FAR less vital than it used to be.

Later,
Gizmo

On the topic of Syquest drives, you'll notice (in recent issues of Computer Shooper, anyway) that the 88MB drives and platters are actually cheaper than the 44MB units. I guess 44MB units aren't being made any more. (Small loss, the 88MB units can read the old platters, and are faster anyway...)

I haven't really had time to form much opinion on the new 3.5" 105 MB units...

>>Could someone tell me exactly WHAT MacMiNT will do ???

MacMiNT will give you a window under multifinder that runs a MiNT kernel. From there you can run most Atari MiNT binaries, as long as they don't try to do anything in GEM, or fancy XBIOS calls.

>>Could I use a Mac to run Atari software ?
>>Or is MacMiNT just a pre-emptive multitasker for a Mac ??

I suppose you can run it without the multifinder, in which case you would pretty much have an Atari emulator on your Mac. But again, it will only run text-based programs. GEMDOS calls are translated into Mac toolbox calls, when possible.
>>
>>Who wrote MacMiNT - Eric Smith ???

Eric wrote MiNT, Brad Pickering at JPL ported the kernel to the Mac.

>I've downloaded all the available versions of MacMiNT, there are three of them. The biggest one with all the gcc

>The last one is the one I am mostly using, all the stuff is within a directory named mint-0. This one doesn't support
>copy-paste or man command as are found with the one I mentioned firstly. But it's definitely stable, and is definitely
>useful if you install the GNU stuff, and the installation may be not tha difficult.

The whole reason Brad wanted to port MiNT was to be able to use GCC on his Mac. Btw, JET means "Just Enough TOS", i.e., just enough TOS emulation to get Atari GCC running under MacMiNT.

>PS. I find MacMiNT's multitasking feature isn't that great even with a Mac with 8 Mb physical RAM, and is incompatible
>with any sort of VM.

No, MacMiNT requires a Mac with MMU, and takes it over completely.

I have a FalconSpeed and it`s not too slow.
It runs Windows 3.1 at acceptable speed.
I was not able to use any programs requiring Color under DOS.
The Communications program (terminal program) that comes with Windooze
doesn`t seem to work.
Haven`t tried any others yet.
Harddiskpartitions are only recognized up to 32 MB or so.

It does not use the 68030, but the video peripherals.

It does not run under Multitos, which would make simultaneous usage of
both CPUs seem possible.

I think that`s about it.

Christian.

This is normal. Photo CDs *are* ISO CDs, so they should be readable with
any
normal ISO driver. Exception: multisession Photo CDs. For this, you'll
have to use a driver which supports the (vendor specific) multisession
commands of the CDROM drives.

This port works with local files, "term" connections and should work with
real SLIP. You'll need a patched MiNT 1.10 and MiNT-Net >=0.42 if you use
tcp/ip. Furthermore you'll need a terminfo file for your terminal, look in
the ncurses directory.

If anyone has any ideas how I can polish this up so it works out of the
box, let me know.

That's hard to say. I think Music Studio used the .SNG
extension, plus Dr.T's KCS uses files w/ a .SNG
extension, and I'm sure there are probably a few other
music programs that use it. If it's a Music Studio file,
you can play it using MIDI Music Maker (MMM).

4314. Re: Connect atari with pc

Newsgroup: comp.sys.atari.st
Date: 1994-06-09 13:06:32 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1846@usdtsg.DaytonOH.NCR.COM>
Source record: 185668

In article <Bas.Hekking-080694124632@ana-dyn-32.mac.phil.ruu.nl> Bas.Hekking@phil.ruu.nl (Bas Hekking) writes:
>I wonderd if it is possible to connect my atary with my pc (by zero mode
>cable??), and if there is software which enables me to load and save atari
>programs to/from my pc harddisc
>I hope somebody can give me some helpfull information!!

If you want to get program files from your Atari to your PC. there's
at least two easy ways to do so:

1) copy the files to a PC floppy disk (which was formatted on a PC -
a double-density disk, aka 720k disk), and then just copy them
off the disk onto your PC...

---or---

2) you could set up a "null modem" connection between the Atari and
PC - what this basically is is connecting the serial/modem port
of the one system to the other, with a "null modem" between...
a "null modem" connection (which could be simply a "null modem"
adapter purchased at Radio Shack, for instance), simply switches
the sending and receiving signals, so what's being "sent"
from the one system is being "received" by the other - you
would use a modem/terminal program on each system, with the
same baud rate settings, etc, and would simply "upload" to the
other system (and since a null modem is not restricted like
a normal modem, you can pull off a connection (and transfer)
of at least 19200 baud...

In short, what *I* did (others may vary) was to get a null modem
adapter from Radio Shack (cost like $8 US), plug a modem cable
from my Atari into one side of it, and plug a modem cable from
by PC into the other side, load up a modem program on both sides,
make sure the settings were the same, type a couple keys to
see if they indeed were being received on the other end,
and then simply started a ZMODEM transfer (or whatever protocol
you like) from the source (in this case, Atari) to the
destination (in this case, PC)...

There's other ways to get files from one system to the other
(via a network, for instance), but the above two are the easiest
ways to do it (and the least hassles)...

Hope this helps...

4315. No download with Connect 2.46

Newsgroup: comp.sys.atari.st
Date: 1994-06-09 13:52:49 UTC
From: bhanses@VNET.IBM.COM
Message-ID: <19940609.045350.491@almaden.ibm.com>
Source record: 185664

I have downloaded the CONNG246.LZH and CONN246U.LZH and installed on my harddisk. Various test with in the German MAUS net are ok, but I am not able to download any files. I know that CONN246U corrects a problem with the Z-modem. When the download starts, a new window opens with path, filename, data and various other infos, but only error messages are produced. The same is true when I use the CONN246H version. I tried X-modem too, but also without success. As I am still in the test phase - and have not paid for registration till now - I have no handbook, but can't see any handling error so far. Could someone verify that the download works with this Connect version on his ST and optionally have a hint what I might doing wrong.

Thanks, Bernd Hanses

4316. slow boot up without IDE?

Newsgroup: comp.sys.atari.st
Date: 1994-06-09 14:01:07 UTC
From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <1994Jun9.140107.26356@cen.ex.ac.uk>
Source record: 185667

I have just replaced the internal IDE on my Falcon030 with a big external SCSI unit. Whilst everything works fine, the boot up is extremely slow. AHDI seems to spend ages trying to talk to the IDE which isn't there.

Is this normal? I have tried turning off the IDE checking with AHDICONF.PRG, but it didn't seem to have any effect. The system seems to take 5 to 10 seconds just to install the SCSI drive. Is there anything I can do to speed things up?
Thanx,

4317. NEED: Fostex MIDI-Remote for Atari

Newsgroup: comp.sys.atari.st
Date: 1994-06-09 14:39:45 UTC
From: ad869@FreeNet.Carleton.CA
Message-ID: <Cr4wq9.1Fx@freenet.carleton.ca>
Source record: 185669

I have the Mac version of this software but need the Atari version.
Its used to do MTC-SMPTE synchronization for a couple of Fostex multitrack
machines. I called Fostex but they dont make it anymore.

IF anyone has the Atari version of Midi-Remote, please email me.

Thanks

>the 88MB units can read the old platters, and are faster anyway...)

>I haven't really had time to form much opinion on the new 3.5" 105 MB units...

At work we have a 3.5" optical drive on one of our PC's. 128mb and
rewritable as well. The speed isn't too quick, maybe a bit faster than a
floppy.
I wouldn't mind one myself but I bet they are rather expensive!!!
(I think the disks are 50 pounds each, no idea about the drive)

: Bollocks - it works fine on my STE 2MB (can't remember TOS ver no., can check
: if you want). Am I the only STE owner who has it working??

It also works on my 1040 STe (TOS 1.6, 1meg at the time). The original
that I bought (in 1990 when I bought the STe) was quirky. It wouldn't
save last mission, wierd display on exit, stuff like that. I sent Disk 1
back to Spectrum-Holobyte (at their suggestion) and they sent me an
upgraded version (I think the upgrade was 1.2). Operation Counterstrike
worked properly from the start. Haven't used it at all for a very long,
long time though.

Didn't Spectrum-Holobyte produce 'Flight of the Intruder' for the Atari?
It came out after 'Falcon'. And wasn't there a second operations disk?
One with helecopters that had to be shot down? ...

4330. Postscript problems

Newsgroup: comp.sys.atari.st
Date: 1994-06-09 18:35:32 UTC
From: gerrymon@eng.umd.edu
Message-ID: <2t7ndk$a1m@mojo.eng.umd.edu>
Source record: 185680

Does anyone know how to print postscript files generated by Microsoft Windows 3.1 on the Atari SLM804 laser?

Ultrascript has trouble with the files generated by the standard Windows 3.1 printer drivers. It seems to print out the graphics stuff fine but all the text are left blank.

I tried all kinds of settings (like telling the driver to only use the printer's built-in fonts instead of downloading them) but the results were the same.

I then tried using the printer drivers that came with Micrografx's Graphics Works and was more successful. I finally got both text and graphics to print but all the text were generated using the Courier font!

Would I have more luck with Composcript? Or how about Ghostscript? Any help would be appreciated!

By the way, these postscript files printed out fine using my school's HP Laserjets so I don't think the problem is with Window's printer drivers.

wrote:

RSR>Would I have anything to gain, speedwise, by going in through
RSR>the "Serial 2" port now in my Mega STE 4's VME slot? Or is this
RSR>delay more a function of TOS?

The Serial2 of my very early MegaSTE allows me to set the DTE to 57k6 with
HSMODA04 installed.

With a 14k4 modem you will notice a *slight* increase of your transfer
rate
(approx. 1670). If you have a modem with 16k8 (ZyXel), 19k2 (ZyX or terbo)
you have to set your DTE as fast as you can to use your modems potential.

A DTE of 115k2 will be appropriate for the upcoming V.Fast style modems.

The most affordable and best supported color inkjets are the
Hewlett-Packard 550 and 560 (the 560 is newer, better, etc., but the
550 is now cheaper and it was very good) or the Canon 600 series.
Prices are about the same on the street but the quality of the 560 is,
I believe, 600x300 while the Canon is , I think, still 360x360 dpi.
There are others in the market now,but these two are the biggies.
Yes you will need special drivers and yes you may have problems
finding them. The printer makers give you Windows and Messydos
drivers and instructions as a matter of routine, but have never been
good on Atari software drivers. the program makers are often a few
years or versions behind.

If you turn off the the pictures except when you really want them it shouldn't be too bad on an Atari. After using in on a IIci, I would be suprised if the Falcon or TT couldn't do better.

Even stripped down to text, it is still a wonderfull way to access all the information on the Web. And since you don't have to wait for a screen to finish loading to go onto the next one it's not going to be too killer for screen size. (in K)

I'm basing all my opinions on using Mosaic on the Macintosh. I have only seen the X version running, haven't played with it myself. Although I imagine that if you use a work station with a direct connection to the network at work or school you probably wouldn't want to use your Atari for it too much. But for people that have no other alternatives I think it will be teneable.

Whilst this is true, CIX does offer some novel additions to the Internet gateway which mean that you don't need special software - just a comms terminal. As the Atari doesn't yet have this special software CIX is still a good way of getting on. For instance, using NOS on the Atari it is impossible to gopher or archie, using Lynx is difficult (you need MiNT & MiNTNet) and Mosaic doesn't (yet) exist for us. The CIX gateway, on the other hand offers everything it can - including a VT100 based Lynx and IRC viewer.

Depends what you want, I guess - if it's e'mail, usenet and ftp then Demon is definately the way to go.

Unless Storm has improved since version 1.01 (1.10?) it'll still have that
very dodgy looking non-standard interface. That put me off of it at once -
it also looked relatively difficult to set up - but so's Connect.

The latest versions of ZIP and LHArc are compatible across the Atari
and PC (and unix, and...):

ST Program PC Counterpart
---------- --------------
STZIP 2.6 PKZIP 2.04g
LHArc 3.10 LHA 2.x

PkARC is *not* compatible with PkZIP!

The latest versions of the Atari archivers can be found at
atari.archive.umich.edu, and other popular sites. The latest
PC versions can be found on various FTP sites as well...

: [STuff deleted]

: >The problem with all the terminals you mentioned is that none of them can
: >scroll with any decent speed.

: Agreed, *UNLESS* you have Warp9 or NVDI loaded in. It's a tradeoff
: of screen updates vs compatibility - Uniterm for instance is a killer
: VT term, but you can't run it in 640x480x256, for instance (at least
: I don't think you can) - ditto with Flash - though both do have
: quicker screen updates than CoNnect or STalker. However, you should
: be able to run CoNnect or STalker in any resolution (I had CoNnect running
: in ST LOW MonSTEred, i.e. 640x400x16, and it worked - not the best
: environment, but it worked) - this is why I would recommend one of those
: two for use *on a Falcon in particular*. Really, with ANY GEM-based
: program, you ("you" in general for anyone) should use Warp9 or
: NVDI - even when using the plain old desktop - it makes a significant
: difference...

Warp 9 didn't help worth squat. I tried the illegal method... I used my
fastest memory-move routine to scroll the screen. It was still too slow. The
Falcon's bus is just too slow! Anything short of using the Blitter in HOG
mode (which would totally disrupt serial communications) is just not going to
cut it.

: >Hey, Anisko! We're waiting on your article!

: ::shrug:: I'll try to speed it along - I don't want to turn anything in
: that doesn't pass at least my personal standards... will get it to GEnie
: in a couple days hopefully...

4342. MiNT and Warp9...

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 00:19:39 UTC
From: anisko@usdtsg.DaytonOH.NCR.COM
Message-ID: <1849@usdtsg.DaytonOH.NCR.COM>
Source record: 185511

Just wanted to mention something I noticed. I usually have MiNT 1.10
(sans patches) and Warp9 3.75 working quite nicely together (the screen
updates are very nice). However, there are two program I've noticed
so far that will freeze me in my tracks under this environment:
ArcShell and VDIMgr. When I try to load one of these, a solid cursor
appears to the bottom left of my screen, and it's "goodnight."

Was curious as to what these two programs are doing that make the
MiNT/Warp9 match act differently than just about everything else
I've been messing with. BTW this is in ST Hi res on a TOS 2.06, MSTe/4...

>finishing my degree. Also what software is required?

The US Robotics Sportster 14400 FAX is quite a good bet, as is the similar spec Zoom one. As long as its V32bis V42bis V42, Hayes compatible - you should be okay. Make sure its BABT approved too (the above 2 are AFAIK). The Supra and TKR ones are also very popular but not strictly legal as AFAIK they don't have the BABT approval.

As for CiX, there is a very good Off Line Reader for the ST, which comes in 2 programs known as CiXRead and CiXComm. They let you do *almost* everything you can do online and allow access to usenet newsgroups. I'm using them to write this message now. Currently they are 15ukp each but AFAIK due to go up in price shorty. Well worth the money IMO however. They are also constantly updated.

:-)

Roland.

I do think that any one using TOS 1.0 1.2 needs there head seeing to,
there are over 2 pages of fixes to TOS 1.4, and FatSpeed is just a minor
one..

What about the Archive bit, the Move option, the Copy Date Fix, shall I go on
and on...

Those that think that they don't need TOS 1.4 just don't know what they are
talking about...!!!

And the Games that don't Run with TOS 1.2 that DO RUN WITH TOS 1.4...

So do your self a big favour Get TOS 1.4, you will never regret it...!!

Dear Atari Creatures:

What we have here...is a failure to communicate.

I'm logging onto a 7/8bit University telnet system (run on Telebyte modems) with my Mega 4 STE, my BRAND NEW U.S. Robotics 14,400 Sportster V.42bis Fax Modem, and STalker v.3.02. I have the fixes from HSMODEM04 installed, even though I'm only running set at 19,200 baud, 8bit, no parits, one stop bit.

No matter what I have tried, DOWNLOADING from my telnetted accounts here, I invariably--I mean absolutely every time--get errors EVERY 4096 bytes--starting at byte 4096--with Z-Modem. My transfers have slowed to around 510cps as a result. My transfers TO Penn, however, have gone like lightning--102% efficiency, over 1200cps. V.42bis on both ends. Go figure.

I've changed every variable I could think of or someone could suggest, except logging onto another system--everything's either disconnected or busy. I've played with the flow control, tried logging in at 9600 baud, and used standard Kermit, Z-Modem, and X-Modem. Everything but Z-Modem gives me no errors at all, but at best a 535cps transfer rate.

I have used the U.S. Robotics template setting, AT&F1, which made no difference whatsoever. Where I come from, if you can reproduce an error every time, that means there's a bug in the woodwork somewhere. Both mail.sas and ccat.sas have given me this problem, and I've use rlogin, telnet, and the tn3270 protocols to reproduce it. I thought that perhaps it was the STe's serial port buffer--but every 4K incoming? And the error message reads "NAK received from remote host." Every 4k. At least I can transfer the big files in, but not out. Not at anything better than 10-20% of capacity.

HEEEEEEELLLLLLLLLPPPPPPP!!!!

Mag!X is faster than AES 4.10 and is much more reliable. It features both
cooperative and preemptive multi-tasking, switchable at any time. You can
also switch to single-tasking at any time. The current version lacks some
AES 4.xx features, but at least it works.

Last I heard, the one meg base falcon was $799, while the four meg version no harddrive is $999. For $1069 list you can get a Quadra 605 with eight megs and 160 meg HD plus a fast 25 mhz 040. And is PowerPC upgradeable.

John,
Degidesign made a version of Sound Tools for the Mega ST series. They have since discontinued support for the Atari platform. I hope they return someday, Sound Tools was a favorite of mine.
To find a new package would be almost hopeless. You might try Rogue Music in NYC or Sweetwater Sound.
A studio I used to work at has a system for sale and I would be glad to help you connect.

Also, Hybrid Arts made a system called ADAP which is similar and I know of a studio selling that system.

Feel free to e-mail me if you are interested.

I have a few 1040ST systems for sale, I will test again, but all are in great working condition:

2 1040STf with mouse...
2 SC1224 Color monitors
1 SM124 Mono Monitor

Like I said, all work great. We had three, I'm keeping one, the rest are for sale.
As you might imagine, I'd like to keep the units together as much as possible and sell as complete systems, but I will hear offers for individual pieces as well since I want to move this stuff...

I've been seeing lots of different prices for this type of stuff, so I don't know what to ask for it, I only ask for offers that seem reasonable.

Reply via e-mail to ez007793@chip.ucdavis.edu

Thanks a lot,

4356. Volume in Falcon-Demos

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 07:30:57 UTC
From: binder@rbg.informatik.th-darmstadt.de
Message-ID: <2t94rh$mm4@rs18.hrz.th-darmstadt.de>
Source record: 185707

Hi!

After we had the discussion why many (german) demos won't work on NTSC-TVs, I think it's also worth a question why so many demo-programmers on Falcon (and not only these) change the volume settings of the Falcon when the program starts (and they do that, of course, using the hardware-registers, not the XBIOS).

It's really annoying when you use a headphone and have the volume set, let's say, to 4, and then run a demo which sets the volume to 15. It's not very nice for the ears...

So, why is this necessary? It's not a programming problem for sure, because you don't have to affect the volume settings when you init the sound-subsystem to your needs. And even if so, it's d*mn easy to save the old settings and restore them later.

Ciao

Thomas

A one megabyte Falcon is completely useless, forget it. I spend far too much time having to jiggle around ACCs and AUTOs because FOUR megabytes aren't enough. I run out nearly every time I do anything remotely complex in PageStream, DA's Vector, DA's Picture, Calamus. (The latter two partly compensate by having their own Virtual Memory support).

Problem is, the buying 16MB not only costs more than I can afford, it only boosts my 4MB to 14. If I could add another 4 to get 8MB, I would be very happy...

>Can someone advise me of the best InkJet or Bubblejet (whats the difference?)
>printer available for the ST at the moment? Colour preferably...
>Do I need special drivers for use with Calamus or Timeworks?
The Hewlett Packard inkjets are better than the cheaper bubblejets, such
as the Cannon BJ10.

The new HP (520 for mono and 560 for colour) are pretty good, but there are
no Atari drivers for these at the moment (as far as I am aware). Therefore,
they will be driven as 500 and 550c printers respectively, and will print
at 300x300 instead of 600x300. Mind you, the grade of paper you use makes
more difference than that resolution improvement anyway, for many applications.

Timeworks has a Deskjet driver. It will drive any of the above HP printers
in mono. Calamus and PageStream have drivers for the 500/510 mono,
the 500c colour and the 550c colour. However, both use very course dithering
algorithms, which give poor quality *colour* output. To get best quality
from my HP 550c when using PageStream, I print it as a PostScript file, then
use GhostScript v2.6.1 to drive the printer; it has more appropriate colour
dithering algorithms.

Most other software supports the HP printers too, eg DA's Vector, GemView,
ImageCopy2, Atari Works, Papyrus,...

: info. that I may find usefull would be nice. Thanks in advance for your
: time. Please email repiles because I don't often have enough time to read

Hi

First, Minix is not PD, so is not available from ftp sites. What you'll
find on ftp sites are updates/patches to the commercial program.

There is a minix demo lurking out there somewhere, I can't remember off
hand....I'll try and put it on HENSA next week, as I've got it on
floppy at home....as well as the full version.

In the meantime, you may want to try MiNT...a proper set up which will
give you a Unix machine inside your ST....to a certain extent. I can
wholly recommend the MiNT distribution kit, which will set up mint
minimally....ie, give you a basic system.....from where you may apply
patches/updates, etc. This can be found on HENSA under :

/micros/atari/a/mint/a017
/micros/atari/a/mint/a018
/micros/atari/a/mint/a019

Be warned that for a017, you will need 9 disks at least, as they
contain 9 .zoo files. The basic set up.

a018 has updates to a017, and a019 has shareable subsets for mint.

Other than that, you may go a differnt route, and not have a
multitasking system at all....just a Unix single tasking clone. For
these I suggest the following packages which are under

micros/atari/tos/m (note: the package codes are directories themselves)

m008 23/10/89 ---- Gulam Unix csh type shell
m010 26/07/90 ---- STEVIE 3.91 Clone of the UNIX VI editor
m017 17/01/91 ---- UW GEM based Unix Windows terminal program.
m025 19/10/89 ---- UNIX TOOLKIT Unix Bourne shell with utilities.
m044 19/10/89 ---- UNIX diff utility
m045 19/10/89 ---- UNIX head utility
m066 19/10/89 ---- UNIX tar utility
m079 19/06/89 ---- Unix lex lexical analyser
m087 20/06/89 ---- UNIX 'du' directory space reporter
m101 10/08/89 ---- Which Unix like program locater

m202 06/11/89 ---- Compress utility. Derivative of Unix utility of same
name.
m519 12/02/91 ---- MAN 2.2 UNIX like help utility
m524 14/03/91 ---- ORCs toolkit - collection of UNIX like tools
m540 19/03/91 ---- TR ST version of the UNIX tr command
m541 19/03/91 ---- WC UNIX like word counting program

Hope this answers your question.

Danny.

Hi, I am looking for various PD games or shareware demos accessible via
ftp. These games are:

Labotomy Invaders
Jewel Buggy
Scramble (as reviewed in STReview)
Klingon War (Star Trek)

If they are unavailable anywhere I'll have to resort to buying them and
then putting them in ftp sites myself.
Any help appreciated.

Alan.

4368. Genlocks?

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 12:06:57 UTC
From: andrewc@cogs.susx.ac.uk
Message-ID: <2t9l11$ncp@infa.central.susx.ac.uk>
Source record: 185715
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Can anyone recommend a (cheap) genlock for my 4M STE (Tos 1.62). I would like the software to be able to be upgraded (so possibly modular). I would also like to be able to control graphics in real time if possible (eg moving a circle around the screen by moving the mouse).

Or better yet, if anyone has a very cheap genlock for sale that I can get started on, then I could be interested in buying. But it must be compatible with UK configurations (240V and PAL tv).

Thanks in advance.

Andrew Collington @ Sussex University, Falmer.

4370. STOS Sample Playback Q.

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 12:51:56 UTC
From: cf580@city.ac.uk
Message-ID: <1994Jun10.125156.28101@city.ac.uk>
Source record: 185718

Hi. I'm running STOS on a vanilla ST, and I need to play back a sample. Unfortunately, I want to do something along the lines of wavetable synthesis; instead of playing a long, linear sample, I need to play through some 256 values (ony audio cycle of the waveform) and then loop to the start. If anyone has any ideas, or code which can do this, I'd appreciate it. Cheers...

4371. ANNOUNCE: STELLO a new Othello game.

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 13:07:20 UTC
From: atari@leonardo.name
Message-ID: <1994Jun10.130720.9089@imada.ou.dk>
Source record: 185717

Hello everybody.

After five years of development, here it is. The ultimate
Othello/Reversi playing program "Stello". Outstanding features
such as

- Works under Gem, all Atari computers, all screen resolutions,
(x resolution must be at least 640)
- Supports Multitos and WINX
- Uses multitasking under Multitos
- Advanced gameplaying algoritms, alfa-beta minimax, iterative
deepening, response killer table, saves game tree and
uses the zerowidth minimax modifikation.
- One of the best Othello programs in the world.
- Background pictures on the board
- Supports english, german and danish (Hey i live in Denmark).

I could go on forever, but why don't you try to download it and
see for yourself. More details in the documentation. By the way
it is a Shareware game. I have uploaded the game to the following
ftp sites, in the file STELLO.LZH.

atari.archive.umich.edu
ftp.uni-kl.de
ftp.uni-paderborn.de
ftp.cnam.fr

Happy Othello playing.
Claus J. Pedersen.

Source record: 185740

Hello world!

I just uploaded the TRAKCOM-Demo to ftp.uni-erlangen.de
(I hope it will be in pub/atari/falcon/sound in two days or so)

TRAKCOM is the radically improved MJUZAKK-followup for the Atari Falcon.

It is a Hifi-Music-Editor, an "Audio-studio in the Box", some kind of a
GEM-Tracker for CD-Quality.
E.g., this version is a full MJUZAKK-Song-Player.

>Tim Wright - T.J.Wright@city.ac.uk

Im assuming you've got STOS maestro installed.

```
5 l=[length of wave table in bytes]
10 reserve as work 10,l
20 for loop=0 to l-1
21 v=[some function to generate the values you want, dependant on loop]
30 poke start(10)+loop,v
40 next loop
50 while true
60 samraw start(10),start(10)+l,[sample_rate]
61 repeat
70 np=samplace :p=samplace
80 until p=np
90 wend
```

Is this what you were looking for?

PS I run the Stos mailing list , email the
above address if you would like to be added

I probably shouldn't reveal his recent ongoing project as it might be
confidential, but it has involved a certain very famous person, whose
name can't be mentioned here (partly because the name cannot be
represented easily in even extended ascii). Anyway, this is all rumour
of course.

:> > 2.5Mb ? (they are about 20$ each) I know you can use 8 or 9 bits, but what
:> > about 32bits ?

They are 256*32, so there's no way to get it working. You could expand a
520 ST to 1MB, though...

:> You need 8 bit SIMMS, or mod the STE to use 9 bit SIMMS, the unused 9th
:> bit must have the inputs terminated to 0v or +v, so just connect pins
:> 28,29 and 30 together....pin 30 is +v....

Nonsense, you don't need to pull them up. They can be left open. No problem.

: programs to/from my pc harddisc

I just began that loading a couple of days ago - having the old ST
with single sided 360 etc funny things. If you happen to have that
combination, you need a couple a little tricks because ST will not
read floppies with 1 sector per cluster and PC will not understand
that the diskette really has 2 sectors per cluster . So they will
understand the fat in different ways. But it goes with some tricks..

Hannu.

I use Cubase and love it. Cubase Lite is obviously cheaper at the expense
of some of the bells & whistles you probably don't need. Come to think
of it I probably don't need them either:-)

I don't know about Breakthrough but I have played with Sequencer One which
was a cheap predecessor. It was OK for the money.

>Please reply be e-mail. Thanks in advance.

An e-mail address would have made this easier:-(

4388. Mega differences

Newsgroup: comp.sys.atari.st
Date: 1994-06-10 16:51:44 UTC
From: GARY.RATLIFF@starnetbbs.com
Message-ID: <82BBE8EF@starnetbbs.com>
Source record: 185741

Well I recently purchased a MEGA 4 thur a for sale add in this newsgroup. When I finally received it the case said MEGA 2 so the CHECK ST program from the HiSOFT people was run to determine my machine structure. There are indeed 4 megs of memeoy and the ROM version is 1.9

The computer however is BRITISH, yet seems to run fine on the 120 60 hz AC. The only real suprise was that PC Ditto told me I had a foreign computer and refused to run. Couldd any of you emumerate what might be the differences between a USA MEGA and the BRITISH setup I have.

How would this fact alter plans for getting hard drive or other expansions. Thanks in advance for those who reply to this querry.

I think you can pretty much null-modem any computer to any computer,
assuming they both produce normal RS232 signals. I used to null modem
between my Atari 8bit and ST, which were two different systems
unto themselves...

I have got some C code called e_gem, which is written in Pure C and german. I tried to compile it today for Lattice C, which the documentation says it should work with, and found a large number of errors. Does anyone have a copy of this in English as my German is almost non-existant, also if someone has managed to compile it with Lattice C can you please tell me how.

Thanxs in advance.

>How do I force these WWW servers to vie these home pages???

You don't. (That feature has been disabled for our anonymous lynx)
However, if you get lynx for your local system, you can "g"o to a
specific url.
The anonymous lynx account at www.twi.tudelft.nl exists for people who
can only telnet from an MS-DOS machine. If you are a regular www user you
should consider getting a local browser.
There exists a lynx for MiNT on ftp.twi.tudelft.nl

> the 88MB units can read the old platters, and are faster anyway...)

My latest Computer Shopper has $98 for 88mb carts, verses $69 for both the 44mb and 3.5" 105mb ones. The 88mb bare drive is $259, and a combo 44/88/200mb 5.25" drive is $409. It does appear that the 44mb drives are no longer available new (though all the Mac catalogs still have external 44mb units for sale, lots of stock I guess). All this is from the Dirt Cheap Drives ad (gotta love that name).

Older 88mb drives could only read the 44mb cartridges. The newer units can read and write them. The 200mb drive can read and write all three (apparently Syquest wised up about this). It appears that all their new drives are completely backward-compatible with older cartridges of the correct size. I'd really like to try and reformat one of my 44mb cartridges to 200mb (probably wouldn't work due to inadequate media density, but it would be _really_ nice if it did :-).

Also, I noticed that another poster mentioned that he/she has a 3.5" optical drive on a PC, and that it is very slow. Note that all the Syquest stuff is standard magnetic media aluminum platter etc. etc., and they all run quite fast (certainly faster than floptical/cheap optical stuff that is currently available). Access speeds run between 13-20ms on all current Syquests (the 44mb units run at around 25-28, if I remember correctly). In other words, they feel like regular fixed disks. The only real annoyance is the spin-up times on the 5.25" units, but that is easy to get used to. The 3.5" units spin up really fast (smaller diameter platters = speed, I guess).

Anyway, the moral of the story is: Syquests are cool (IMHO).

I seem to remember that there was a non-obvious (to me, at least) trick in
setting up the dial-command string. I think you have to put a "|" at the
end to tell it to hit return (something like AT#|). I remember that the
default string did not work for me (on some previous version of CoNnect).
Pop up the modem string dialog and hit the help button for more details.
Hope that helps.

> (The new version) with this ??

TOSWIN needs MiNT. It is possible to start the MagiX AES after MiNT was
started from the auto-folder, but then you can only use it in single-task
mode.

> It replaces everything but the file selctor is dependent on the desktop you use

The fileselector is part of the AES, the desktop application is not.

> Thanks a lot.

I can get it to work sometimes, but not other times. I think the problem was with my floptical drive. I'm not sure, but it seems to lock up if I boot with my floptical on.
But I got lemmings to work on a tv or rgb monitor (no vga) with all the backwards settings set to there furthest right position with the exception of sound (off), harddrive (off) and ram (512) which are all at the furthest left setting. Does that make any sense? then press return to reboot the computer and insert the lemmings disk. The game seems to run a little flickery, but is playable.

Agreed whole-heartedly, and that's why I do my mailing using both facilities,
Demon for Internet wandering and cix for searching files out. The best of both
worlds working together.
Hopefully though the Atari software will be developed and we will see the other
features coming into operation from Demon. Full internet access is starting to
become a reality on the Atari.

t> seemed always a bit ridiculous to me.

Although this is excellent news at first glance, I can't help wondering if there aren't some worrying aspects to this. If Atari are allowing free binary distribution of MiNT, it suggests to me that they aren't even considering releasing any new versions themselves in the future => no new versions of MultiTOS => no publicly available AES 4.1. Could be unfortunate - I just hope I'm wrong!

Whilst it is true that there are no gopher, archie or www clients available
from within NOS on the Atari it is still possible to access public gophers,
archies and Lynx www's via telnet. Some of these are VT100 based but I think
there is a program called AnsiST which will provide the translation on the ST
although I can't remember where I saw it (probably on ftp.doc.ic.ac.uk under
/computing/systems/atari/umich/). You also need to set echo to accept from
within NOS on some of them.

Try telnet info.cern.ch or vms.huji.ac.il for a public www.
Try telnet archie.doc.ic.ac.uk for archie.

There are many others which AFAIK can be found in a list on ftp.demon.co.uk
in the /pub/doc/ directory somewhere.

>Couldd any of you emumerate what might be
>the differences between a USA MEGA and the BRITISH setup I have.

Well the British one is better of course ;-)

Seriously though, the keyboard will be different. You will have the UK pound symbol on the '3' key and the '#' will be elsewhere. A few other symbols will be moved around.

Also it will have a 50Htz PAL mode instead of a 60Htz NTSC mode. Can't remember if the Mega ST has a TV modulator, but if it does, it won't be any good to you.

There are slight differences in the ROMS, but essentially you shouldn't have too much trouble. A good proportion of STs are British ones. Software tends to work on them. Apparently there are more German language ones than anything else though.

:-)

Roland.

For now, O supports Internet (i.e. Hermes, usually) and Mausnet
only, but sources are available if you'd like to write something
like an importer QWK, Fido etc. Due to the modular structure of
the Okami system, all you have to do is write special import/export
programs and do just minor changes to the newsreader itself.
Mail me at wr@bara.oche.de to find out how to get hold of the sources.

>or code which can do this, I'd appreciate it. Cheers...

Hi Tim!
The only way I can think of doing it is so actually sample (or otherwise
generate) the various waveforms (different variations of sine, saw etc)
and play them end to end by the DMA chip).

The DMA can play up to three channels of sound, so if you wanted to get
adventurous then you could actually crossfade between the samples (but
you'd probably need to do this in assembler of something, STOS is
probably not low-level enough for that sort of thing).

To do it really well is not an easy task!
(How much does a Wavestation cost...? :-)

Yes, there was/is a second mission disk - you vs Mi-24 (Hind) and Mig
bomber/fighter missions. You also have medium range missiles and HARM
anti-radiation missiles. Quite good, never finished it though :-(Don't know
about Flight of the Intruder.

Pretty cute, I like it! Actually ST stands for Sixteen/Thirty-two
and TT stands for Thirty-two/Thirty-two. The 68000 chip can process
32bit integers bot it only has a 16bit external data line. The 68030 is
a 32bit chip with a 32bit external data line.

Feel free to correct me if I'm wrong. I doubt anybody would hesitate if
such was the case, anyway. :)

I've got my doubts that this would be feasible, since the '030 and the
Falconspeed board sit on the same bus, and only one of them can control it.

If you are running the 386 board, then the '030 is basically just sitting
there and unable to do anything.

4434. Pricing for Atari Mega ST

Newsgroup: comp.sys.atari.st
Date: 1994-06-11 04:20:43 UTC
From: pietrzak@sparc7.cs.uiuc.edu
Message-ID: <2tbe2r$4s2@vixen.cso.uiuc.edu>
Source record: 185583

Hi

I have a Mega 4 ST set up in a mainly DTP manner (Mono monitor, ultrascript, etc). I was wondering, what kind of price could I get for this kind of system currently? I've really only used it as a terminal in the last few years, and I've lost track of the Atari community, so I have little idea about pricing for these systems now.

I presume Mega STs can be had for less than $1000 these days. ;)

Thanks

John

I think Yak the Hairy was last seen involved with the Konix
system that never made it to the market. You might try in the
emulators group. More Atari/CBM users hang out there.

>it also looked relatively difficult to set up - but so's Connect.

It's 1.02 now (.01 greater than the last you tried.) and has the
same interface. It hasn't seemed dodgy or non-standard to me at all.
(Standard _is_ a relative term ya know. :)
In fact, STorm has (IMO) one of the best implementations of a
keyboard short-cut I've seen. (Everest having an equal or better
implementation.)
In general, Connect has the non-standard interface -- it not only
uses a command line, but has a command bar _inside_ the comm's window.
This is not bad, just non-standard. (The only program I know of which
uses this.)

* All uses of the word 'standard' are notwithstanding the current
gem-list discussion as both Connect and STorm were written previously.

: rmccall@mcs.dundee.ac.uk (Rod McCall) writes:
: >Does ST stand for Sam Tramiel? and TT Tom Tramil or something?

: >Only joking.

: >Rod

: Pretty cute, I like it! Actually ST stands for Sixteen/Thirty-two
: and TT stands for Thirty-two/Thirty-two. The 68000 chip can process
: 32bit integers bot it only has a 16bit external data line. The 68030 is
: a 32bit chip with a 32bit external data line.

Actually, it goes farther than that. The 68000 has a 16-bit ALU inside, so the microcode must do two or more operations throught the ALU to process one 32-bit operation. Additionally, the 68000 has two-level microcode. The machine instructions drive one level of microcode engine, which in turn drives yet another microcode engine below it.

If you've ever wondered why divide and multiply are so slow, now you know. Two very complex 32-bit operations are being driven by two levels of microcode through a 16-bit ALU.

And despite it all, 68000 instructions, on the average, take fewer clock cycles than 80286 instructions, and in some cases even ourperform 386 instructions. Makes you wonder what planet Intel was on when they designed these chips, but then considering the design of the 8086, a massively hacked-up kludgey redesign of the 8085, they may not have had much choice.

: Feel free to correct me if I'm wrong. I doubt anybody would hesitate if
: such was the case, anyway. :)

: They do if you have NVDI. No program can scroll at a 'decent' speed
: without NVDI if it's written to follow the GEM guidelines.

: ------------------------------
: Ofir ogal@cix.compulink.co.uk
: ------------------------------

As I said in another post (which you may not have seen), I tried NOT following
the GEM guidelines and used my fastest memory-copy routines to scroll the
screen. They simply were NOT fast enough. It's not the fault of GEM, VDI, or
any other software problem, but rather the fact that the Falcon simply does
not have the bus bandwidth to move even the most moderate amounts of memory
at a decent speed. I would imagine that even the Blitter in HOG mode wouldn't
be fast enough, but that's out of the question because it would totally
disrupt serial I/O.

Try setting the 68030 and Blitter to 8MHz, turning off the caches,
and setting the 'DMA Sound Exeption' to "Timer A" (using Backward).

Interesting. I'd had a brief go at this - 'telnet archie' just hangs - but I'll
have a go at the ones you mention. Thanks.

What I meant to say was that non-GEM programs don't get much of a speed-up.
But, apparently FZT uses the VDI for screen output so is sped up - I don't know
if this is true of Protext.

I didn't mean to infer that there were problems - just that you didn't need
NVDI if all you use are TOS programs.

GEM-View is probably the best option.. it can even do batch conversions.
It's available at most atari FTP sites.

On the PC, the only program I know of that can touch IMG files is something
called 'Alchemy' - but never having seen it, I dunno how effective it is.

No, but it's been in beta testing for almost a year now.

AFAIK, MultiTOS still ships with MiNT 1.04 (1.10 is current, and will be
replaced by 1.11 in the next couple of weeks) and AES 4.0.

I wrote a .3d2 to RAW triangle converter; you can then use raw2pov to
change it into a bunch of smooth triangles for POV-Ray (raw2pov also
knows about POV 1.x and POV 2.x differences).

The source code and Atari binaries for cad3d2raw should be on
atari.archive.umich.edu as well as the official POV-Ray site in
Australia (uniwa; dunno the whole address).

53 megs?!? That's truly bogus... I think the largest one was maybe 3M
or so before compression.

Are you sure you transferred the files in "BINARY" mode?

> If others have experienced the same problems, could you give the upload
> another try Chris?

I could, but I'd have to build it again; if I do that, I'm going to make
a sharable "merged" version that will require a minix partition (and
MiNT)... on the up side, it'll only take about 400k of disk space for
the binaries.

The PBM-Plus package hasn't been upgraded in quite a while; NetPBM is
PBM-Plus with bug-fixes, added filters, etc... a sort of super
PBM-Plus.

> Feb, 1994 ST-User...

Any text editor that requires me to touch my mouse isn't fast enough...
can Tempus exit and save with a keystroke?

Tempus also doesn't have CMODE or WRAP modes; CMODE makes my C/C++
programming faster, and WRAP makes my news posting faster... ;-) Oh,
and did I mention the macro language? I love MicroEMACS...

DS> difference! A freebie is preferred, but I'll buy the s/w if
DS> necessary.

CoNnect is great with the Falcon... The version I'm using is 2.46 and I think
its the latest version.. Its s/w. It is supporting baudrates up to 153600, and
thats enough!
You can use the MIDI port (fixed at 32500 baud) or the serial port but not the
LAN port.

Hi Darren. This sounds great. Derek's e-mail address is
derekm@microsoft.com. I am not sure where the code is available.
I asked Derek and will pass on the info as soon as I get it. Or
does someone else on the net have access to the code? I planned
on getting the ST Xformer cable with an 8-bit drive when I had my
STe and was disappointed to find out that ST Xformer crashed on the
Falcon. There's a ton of 8-bit software on atari.archive.umich.edu.
There are also quite a few places that sell 8-bit software cheap here
in the US. I'd imagine there are some sources left in the UK as
well. Keep me informed on what goes on. Hopefully this project
will work out!

4464. SPEED OF LIGHT 3.1 unleashed!

Newsgroup: comp.sys.atari.st
Date: 1994-06-11 20:07:32 UTC
From: sdenman@wolf.cs.washington.edu
Message-ID: <1994Jun11.200732.6291@beaver.cs.washington.edu>
Source record: 185513

I tried to post this before, but it never showed up, so...

I'm proud to announce the release of SPEED OF LIGHT Image processor/
viewer version 3.1. This is the first public domain shareware release
since version 2.6. It has been uploaded to the following ftp sites:

atari.archive.umich.edu
ftp.funet.fi
ftp.tu-clausthal.de
ftp.uni-kl.de
world.std.com

and also to Genie, Delphi, and Compuserve.

Here are some of the coolest features in this ALL NEW version:

>> The most complete color editor available on Atari computers. Tools
include copy, swap, gradient, rotate, color sorting, load, save, etc.

>> Incredibly cool histogram editor allows you to edit color
transformation histograms, contrast histograms, and color selection
ranking histograms. Tools allow preset gamma and linear histograms,
plus freehand draw, squash, flip, stretch, load, save, etc.

>> Image manipulations tools include INSTANT SCALING (to the pixel),
FLIP, ROTATE, BLUR (with FIS), and MANY histogram color-manipulation
tools.

>> Load more image formats than before, including GIF, **> JPEG <**,
Prism Paint, and GEM Ximage. Use wildcards to load more than one image
at a time, or load them one-by-one as you need to.

>> Save in GIF, Degas, Prism Paint, and GEM Ximage.

>> Dithering! You can even load in .DIT files (GEMview compatible).

>> Filtered Image Scaling (FIS). Probably the most powerful tool SOL
has to offer. This is like averaging in version 2.6, but allows you to
use several different filters, and works on enlargement as well. This
effectively smooths out enlarged images so that there is no pixilation.
You can also use FIS to blur the image. You must see this to believe
it; sample images are included with the shareware version.

>> Speed, speed, speed! This is the fastest JPEG viewer without a DSP
chip! Loads JPEGs in one-third the memory that other programs require!

This is just a taste of some of the new features version 3.1 has to
offer. Download it today! As always, comments can be sent to:

sdenman@cs.washington.edu

Have fun!

The proof's in the pudding really, and I don't find Connect too slow for my
tastes, even in 16 colour mode. Much better than some dodgy !TOS!GEM rubbish
that's guaranteed to break down come the next TOS version.

> Don't ever use any software that uses Ctrl-A for Select-All

Do you mean a window menu? There are quite a few programs which use this:
GEMBench, GEM-View, Edith, Hisoft's Voice Mail, Papyrus (I think) - it's
becoming more and more of a standard.

Connect uses it and other pretty standard GEM stuff better than any other
program I can think of.

ALL ST Software.

I am also looking for an ST external Disk Drive (SS or DS is fine working
or not!)

Atari 1040 STf w/ TOS 1.0 has slight crack in case. Cosmetic only.
SC1224 (JVC model) in great shape

Atari 130XE with Power Supply excellent shape
Atari 1200XL with P/s in excellent shape
Atari 1050 Disk drive w/ P/s great shape (I have two of these)
Atari 1050 Disk drive for parts (yes, it MIGHT work but then again I am
not asking that much either!)
Atari 1010 NEW in the box

Thanks
send mail to the above address until 18 June or to:
mbates8@genie.geis.com

This copy of Freddie 1.2 is being evaluated.

4476. DMC Release of 6/11/94

Newsgroup: comp.sys.atari.st
Date: 1994-06-12 02:34:33 UTC
From: Sean Dougherty <pdirect@delphi.com>
Message-ID: <Jo+N-1R.pdirect@delphi.com>
Source record: 185530

The following is DMC's release of 6/11/94.

June 11, 1994

DMC Publishing, Inc.
Toronto, Ontario, Canada

This morning I received email from a customer drawing my attention to a particularly misleading, and entirely erroneous statement in the latest STReport, even more so than usual. As a rule I ignore Ralph's comments but every now and then he leaves me with no choice but to clarify as his message is so potentially misleading and damaging. This is one of those times.

The following is an excerpt from the SILICON TIMES REPORT, INTERNATIONAL ONLINE MAGAZINE, June 10, 1994, issue No. 1024, Publisher-Editor Ralph Mariano from his column, STReport CONFIDENTIAL.

~~~~~~~~~~~~~~~~~~~~~~~~
- Chicago, IL NEW "LIFE" for CALAMUS SL??

According to our sources in the European marketplace... Calamus SL, long recognized as a premier DTP package in Europe, is to be supported by a new company, Adequate Systems, having been formed by a splinter group composed of the original programmers responsible for the Atari modules and code. The group broke away from DMC GMBH recently after the announcement made at this year's CeBIT that DMC GMBH would no longer support Calamus SL for the Atari marketplace. It was further reported that DMC GMBH has put all their efforts in the making of the Windows NT version. At CeBIT of 1994 the following happened. DMC GmBH has told their Atari customers, because of the market situation and Atari, we recommend that you buy a system capable of using Windows NT.

This upset many Calamus customers both present and future. Concerned customers switched to the Mac, which was fast becoming less expensive due to repetitive discounting by Apple. Since NT had, so far, proved very disappointing to DMC Germany's expectations, especially after Microsoft announced that it will NOT market the product on a wide scale. NT was NOT the OS to replace windows for your everyday PC and PC Clone.
~~~~~~~~~~~~~~~~~~~~~~~~

It was further reported that Adequate Systems, unfortunately, does not hold any of the copyrights to Calamus or SL or any portions of the code contained therein. At this point DMC GMBH is not willing to relinquish any (c) holdings. However it is rumored that Dr. Reidhl, newly appointed to the board of Directors of DMC GMBH and marketing manager, formally of Atari GMBH, is attempting to reach an amicable agreement with the newly formed Atari SL programming group's company Adequate Systems. Hopefully, another Chagall-like episode is not in the wings.

~~~~~~~~~~~~~~~~~~~~~~~~

There are so many errors in the above few paragraphs that I hardly know what to say or where to start. Most of it is utter nonsense. Absolutely no attempt was made to contact DMC Publishing for clarification!

As the above paragraphs could be potentially damaging to DMC Publishing, the fact that I was not contacted can only confirm that this was a deliberate and malicious act, by a totally irresponsible journalist, Ralph Mariano, acting out of personal motivations that had nothing whatsoever to do with truth, reality or journalistic integrity.

As usual, Ralph took a grain of truth and distorted it to fit his personal agenda.

Last December, 4 programmers, long-time members of DMC GmbH, left DMC to form their own company, Adequate Systems. It is their published intention to continue to work on additional modules for Calamus SL, for which they have my respect and support. I've known all of them personally since 1987 and I'm certain they'll produce excellent quality product! They have a few modules in the works right now although I wasn't prepared to announce them yet. We are still finalizing the details, North American pricing struture, English translation etc.. I expect to have 3-4 new Calamus SL modules from them within the next 90 days, which is great news for our established Atari Calamus SL customer base. The new paint and drawing module, in particular, should be a major success. It has long been awaited.

Calamus is owned by DMC. There is no conflict in this regard, none!

In-house programmers are currently working on a new version of Calamus SL. Again, I will announce further information on this subject at a later date when it is more appropriate.

An entirely separate team of DMC programmers are involved with the NT version of Calamus. Basically we are talking about different divisions within the same company.

I hope this clarifies the situation for any of you that read Ralph's nonsense. Please post this message far and wide to insure that everyone gets the opportunity to read it. I will post it myself on
~~~~~~~~~~~~~~~~~~~~~~~~

Compuserve, Delphi and GEnie but I do not frequent the Internet or any more local bulletin boards so I'd really appreciate the assist in spreading the word around. In future, if STReport says anything about DMC, Calamus or myself, please take it with a large grain of salt and contact me directly. I will be pleased to clarify.

Sincerely
DMC Publishing, Inc.

Have you got any problems with compilation? I try to use GShell 1.8
and have many problems. It bombs very often. There something to do
with the control panel and what cpx are loaded but in most cases
I leave the control panel out if I want to compile a program.
Have you got a solution to this?

Michael.

4478. GSZRZ Shell

Newsgroup: comp.sys.atari.st
Date: 1994-06-12 03:39:58 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <2te02e$krk@golem.wcc.govt.nz>
Source record: 185536
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

As I use Flash 1.6 most of the time, I need a shell
that supports GSZRZ 3-4xx.. (Zmodem)

I can use Flash 1.6 to dnload files, but not to upload them,
no file selector support..

So were can I find a shell for this..??

For some reason or another my STORM no longer works, could be ASspeed,
NVDI or HSMOD4, I have yet to find out, all files seem to get corrupted,
the same happends to C-Kermit, plus I can't get C-Kermit to upload at all..

This is why I wan't to stick with some thing that I know works...

Flash 1.6 with GSZRZ....

Thanks......

In a previous article, dburns@world.std.com (David R Burns) says:

>I've been using Gemview for a while, and I'd like to register it. Is it
>possible to do that here in the US? I'm not keen on sending away to
>Germany to do it, and I thought I saw some talk here indicating there is
>a US distributor.
>
>Please include the correct price, and if it comes with a manual; is it on
>disk, or will it be e-mailed to me?

The price was $40 CNDN, the manual is in English and is on the disk, and I
got a disk sent to me in the mail within a few days. You can always pick
up the latest update at your closest Atari FTP site as well.

>

I am not sure what the procedure is supposed to be in the States but I
registered my version through Cybercube in Toronto. It is a superb program :-)

Sb: #99511-#IMPORTANT INFORMATION
Fm: Dana P. Jacobson 71051,3327
To: Nathan @ ISD/DMC 76004,2246 (X)

Nathan,

You always seem to amaze me with your complete misunderstandings of what you actually read and what is actually being said. No matter what, every time anyone mentions something directly or indirectly related to you or affiliated with you, you automatically get paranoid, that you're being attacked in some fashion.

You also show that you have a flair for the overly-melodramatic, with your poor choice of words and statements. In the message that you left earlier today, which was so full of generalizations and innuendo, you attempt to point fingers and say that Ralph is attempting to deliberately and maliciously damage you and/or DMC Publishing.

I'm sorry, but I will not sit idly by while you continue to impune the integrity of the magazine that I work for, no matter what you or others may feel. STReport has gone throug
h many positive changes over the past 9 months
or so that I cannot, in good conscience, allow you to continue just because you can't live with reality.

The "word of Nathan" just doesn't hold up to the esteem that it did years ago. Your feeble attempts at placing the woes of the Atari community at STReport's

Press <CR> for more: door is your trademark lately. You continue to blame Ralph and/or STReport and
its staff for bringing out into the open those things that you may rather see remain behind the scenes.

Let's look at your opening paragraph and see just how misleading _your_ remarks are!

Nathan writes:

"This morning I received email from a customer drawing my attention to a particularly misleading, and entirely erroneous statement in the latest STReport, even more so than usual."

Excuse me??!! Particularly misleading? Do you understand what the word means? Misleading implies some truth, yet you then go on to state that the entire piece in STReport's "Confidential" is erroneous. And to then add emphasis, you say "...even more than usual." Either it's true, or it's erroneous - there's no "more so than usual"!! And then you add later in that same paragraph that the information in that article was "so potentially misleading and damaging." Here's Nathan's paranoia showing through once again.

Near the end of Nathan's long-winded message, which by the way, never did

Press <CR> for more:
contradict a thing that the "Confidential" article said, he adds more baseless accusations:

"As the above paragraphs could be potentially damaging to DMC Publishing, the fact that I was not contacted can only confirm that this was a deliberate and malicious act, by a totally irresponsible journalist, Ralph Mariano, acting out of personal motivations that had nothing whatsoever to do with truth, reality or journalistic integrity."

The information that was given to STReport in this regard was something that I had heard about over two months ago. From what I understand, this information was known _over_ 6 months ago, but Nathan never said a thing. It's also well-known that Nathan has publicly requested that we do not publish any of DMC's press releases or even any messages pertaining to DMC products. Does he really expect any of us at STReport to contact _him_ for confirmation of _any_ news that pertains to his company or products? He told us _not_ to do so!!

So now, since no one asked Nathan about the information that we had, it's a deliberate and malicious act done by an irresponsible journalist out of personal motivations....!

Nathan - show me where in that article you see maliciousness. Show me where

Press <CR> for more: Ralph makes it a personal agenda. Show me where the informa
tion therein that's
false - not a "little wrong or misleading,", bu
t FALSE. Show me how it can be
damaging, other than the truth hurts.

Nathan, every time STReport publishes something that you don't like, you come online and spout off with a cloud of rhetoric. You attempt to shift the blame and cloud the issues that no one has any idea what could be possibly wrong; but if you say STReport is to blame, they should believe you instead. It just won't work any longer. Your evangelistic "powers" have waned; your "flock" has slowly dissipated.

Nathan has asked you to re-post his message to other services and bulletin boards. Please do. You may also want to supply my above reply - let's keep this a 2-way street. I also understand that Ralph has replied to Nathan's

diatribe on CIS. I will read and capture that message in case someone would like to pass it along also.

>>My response speaks for itself.

It certainly does, Nathan - your response said absolutely nothing. You clarified _nothing_ and your comments did not contradict a thing that the STR Confidential article stated. Answer my questions that I posted for you in the message to which you just replied, if you can. Ignoring them only re-enforces my message, Ralph's message, and the information contained in STReport 10.23 "STR Confidential".

Dana @ STReport International Online Magazine

To: [F] Nathan 76004,2246

Nathan posts;
"This morning I received email from a customer drawing my attention to a particularly misleading, and entirely erroneous statement in the latest STReport, even more so than usual. As a rule I ignore Ralph's comments but every now and then he leaves me with no choice but to clarify as his message is so potentially misleading and damaging. This is one of those times."

In Reply;
In as much as you elected to make this matter personal, I must warn you

that I too, feel your comments have the potential of being damaging. Not to me but to what's left of your waning credibility. You see, even with all your fussing and fuming, you have FAILED to CONTRADICT _anything_ presented in STReport 1024's STR Confidential. Ordinarily, I'd pass over this latest diatribe from you but in this case, I felt the need to point out how it is so true to form. Your form. Rarely if ever do you have anything to say about anything in STReport unless of course STReport hits the the proverbial "nail right on the head"!

Your insulting, negative comments are truly inexcusable but they must be overlooked when one considers the source. Speaking of agendas, why is it you must bring this agenda baloney into the matter? The only "agenda" hanging out in the open for all to see is yours. "Let's BASH STReport". Yessir, continue to play kill the messenger! You'll do much for your cause and credibility.

Typically, this appears to be another of your masterful attempts at distracting the readers from the real issues .. Like... What's happened at DMC GMBH and of course, Adequate Systems? Why is it that it took a release of this information to bring you forward with YOUR story? Why didn't YOU tell the market YOU supply what was going on when it was happening back in December? This is JUNE fully six months it was kept from this market. WHY?

The users deserve the truth... the truth about DMC GMBH, the truth that there will be a new Calamus source, the truth that what was stated did indeed occur. No smoke and mirrors, no diversions and absolutely no "confusion". The truth about the Copyright claims and negotiations. The truth about DMC's GMBH statements made at CeBIT about leaving the Atari market and advising users to buy into the NT market. I will not address the fact that you reproduced a portion of STReport at all since you actually did STR a good turn. Your lamenting, when compared to what appeared in STR, clearly indicates that you have failed to contradict anything.

Many thanks to Bart and was it Daniel also?

I've found that www.lbl.gov lets people use the "G" command even though
they are anonymous users. Since this is a student account, I don't have
permisson to run a MAKE on a lynx program for this system.
Besides which, most of my efforts would probably be for naught... since
in two months I move... AGAIN... and will no doubt end up with yet another
different account.... starting back at square one.
Well, at least I will know where to telnet to when I need a lynx server
for now. Thanks guys.

Jeff

4483. AGT adventures on the Falcon (again)

Newsgroup: comp.sys.atari.st
Date: 1994-06-12 04:51:38 UTC
From: fnjah@aurora.alaska.edu
Message-ID: <1994Jun11.205138.1@aurora.alaska.edu>
Source record: 185539

I posted a message a while back asking if anyone knew how to get AGT working
on the Falcon because I did it once, but then couldn't duplicate it.
I figured out that it was because I used an old version of Warp 9 I got from
some ftp site a long time ago that I usually don't use anymore.
I thought maybe there was someone else out there who might want yo use AGT
games on their Falcon.
Thank you to whoever suggested geting NVDI. I wouldn't have figured it out
otherwise.

Except that Atari's CHKDISK3 is a DEVELOPER-ONLY utility (or at
least is SUPPOSED to be!). Atari doesn't even suggest that
developers use it due to some bugs in the program.

In article <2tdjpp$j9p@golem.wcc.govt.nz>
sheppard_r@ix.wcc.govt.nz "Roger Sheppard." writes:

> I am interested in the Costs of CIX, there have been a lot of new Internet
> providers here, so I would like to compare costs with CIX, and what do you get
> for your money, services ,etc...???

Okay, CIX costs 25ukp to join and has time charges of 6p (standard) and 4p (cheap)
- these are UK phone times, standard is 8am-6pm mon-fri and cheap is all other
times. For your money you get access to the CIX system (like a bulletin board -
only much bigger, something like 11,000 users and 8,000 conferences (like a
newsgroup but broken down into different topics). Conferences may be public,
closed or confidential and any topic can hold a file list (a directory).

Anyone who wants to can set up a conference and become a moderator. CIX has no
extra charges for anything (i know of) apart from the FAX sending facilities.
There is a minimum charge of 7.25ukp a month - which is often hard to beat using
an OLR.

> Do they offer SLIP/TCP/IP and UUCP or just a dial in Internet service
> and at what speeds..?

They currently offer a dial-in internet service which you can use for just
about any internet purpose. A lot of the functions have been streamlined,
often to get around the need for slip/tcp/ip/ppp - so, you type 'lynx' and
CIX runs its own lynx program which sends VT100 codes back to your comms
terminal. I don't *think* it's possible to run mosaic through CIX - but I
may be wrong. Stuff like archie, irc, ftp, telnet, gopher is all there.

Usenet news and e'mail are handled by the standard part of CIX - instead of
sending mail to just 'sabbath' (a CIX user) you'd send to 'sabbath@... 'etc.
The newserver is pretty much transparent to the user, as almost everyone uses
one of the many OLRs (the atari one is meant to be best) news is sent batched
then split by the OLR and it appears like any other conference.

CIX has upwards of 100 lines, most of which are v32bis/v42bis and 4 of which
run at 28.8KBaud. There are also some ISDN lines.

There are rumours that CIX will soon have its own SLIP connection - at a flat
rate each month (much like Demon).

I dunno - doesn't NVDI speed up text output as well? Although I must
admit, seeing that Protext runs really fast anyway, NVDI doewsn't make too
much difference!

**** HELP ****

I am still trying to install J_OFFICE on my 'D' drive.

I know about changing the ACC to a PRG and holding the ^ Key Down,
but what path am I selecting...??

The same with J-OFFICE.PRG, its asks for 2 Paths of what.??

I just keep getting a dialog box with some thing about a Module..!!

Gee when are we going to get English versions of this software..

The same with COMA, NO ENGLISH DOC's = NO MONEY...

I can't even read what I am asked to send for COMA..??

Zuerst die Gebhren:
Vollversion CoMa ohne Handbuch DM 89,-
Vollversion CoMa mit Handbuch DM 99,-
Vollversion CoMa, nicht EU-Staat DM 109,-
Vollversion CoMa und Voice mit Handbuch DM 149,-
Vollversion CoMa und Voice mit HB, nicht EU-Staat DM 159,-
Upgrade CoMa auf Voice DM 50,-
Upgrade CoMa auf Voice, nicht EU-Staat DM 60,-

PLEASE PLEASEwhat does this meen..??

Looks more like a shopping list to me....

But I don't intend to sent any FEE with out English DOC's..

Please you German authors, please wake up and write English doc's for your
programs, that is if you meen to sell them..??

Does any one know when there will be a Demo version of Strait Fax II..??

I would like to try before I buy...

Seems like that is the only decent English Fax Program there is for the
Atari..??

Can any one Help..??

From: jpb3@ukc.ac.uk
Message-ID: <8431@merlin.ukc.ac.uk>
Source record: 185413

I recently got the latest version of LZH from a mirror of a.a.u.e,
which contains the GEM Lzhshell. That is: lha310.tos.gz.

The problem is, I've found a bug. I use neodesk all the time, and
I found that whether you make Neodesk not unload for execute or not, that
when you quit the LZHShell, you will not return to Neodesk, but instead
you will be thrown back to standard GEM.

Has anyone else found this, or is there a way to stop this happening,
as it is quite annoying. It also reminded me how bad the standard GEM
desktop for Tos 1.62 was :-)

Here's hoping for a bug fix...

can anyone out there help me with a problem i have with this program?????
I am unable to load any exported CVG file that has a filled object or
a gradient filled object into Calamus SL. I can export an object as a
CRG file, but it will only come out as a mono file of course. If i save
a filled object as a DIG file, it seems ok but of course i cant import it
into CALAMUS. Is there something wrong with my software????? Am I doing
something wrong????? If i can only save in colour as a DIG, is there
any program out there that can convert the DIG to CVG???????
or is there another way that i cant think of??????
THANKS John Moon s9205525@otto.bf.rmit.edu.au

If your looking for any basic Falcon RAM upgrades, Toad was selling
a kit for $90 (unpopulated) or thereabouts, that uses regular
SIMMs and plugs in place of the existing RAM board. I populated
mine with 4mb modules, and have 14mb. The only problem was
the damned shielding on the Falcon. In my case, I just yanked it
and tossed it...

: Give us some more information. Which operation system are you using.
: Did you apply any serial patch to your \auto\ folder? How do you
: 'put u:\DEV\MODEM1' ?

Well I am using TOS 4.0 & MTOS 1.1 (beta). As for patches I haven't got
any installed. However it bnow 'appears' to be working. All had to do was change the modem
strings and put a '|' after them.

As for putting u:\DEV\MODEM1. I mean I put that preceeded by setenv in the
MINT.CBF file.

Wrong!! There will be a PowerPC upgrade for the Quadra 605, LC475, Performa
475 and 575. The upgrade consists of a daughter board that plugs into the 040
socket, with the 040 plugged into the daughter board along with the PC601.
Will costs less than the $699 PowerPC PDS card for other Macs. Apple had it up
and running at their World Wide Developers confernce a week ago. Should be out
this fall. This info came from last months edition of MacWeek.

Oh, by the way, isnt anything that the defunct C= made was not upgradeable but
a Throw - Away- hardware....

From: sforseil@vub.ac.be
Message-ID: <2tfqa4$287@rc1.vub.ac.be>
Source record: 185430

Hi ppl!

I need to do an accounting program on an Atari. I'll be working
on a TT. I wanna use some database features for stock management
and things like that. I also have to do it uner gem, with menus,
dialog boxes and other gizmos.

So what's the best? I heard of DBman but I don"t know if it's
a compiled language and if it can handle GEM.

In fact the database part is not the problem. I'm mostly an X-Windows
programmer and I don't want to learn all that gem stuff for a program
that I won't sell many times. So are they some good 'visual' code generators
for windowing with GFA or Pure C?

Thanks for your help!

I have the RAMGizmo in mine. I also have 16(14)megs. But my SIMMS are
really short so I didnt have to remove anything except the speaker, and
that was removed the day I got the Falcon030 when I put in a 68882 math
co-pro. I like it, but It was a tad difficult to put in. I think the
measurments were literally a hair off as I had to nearly bent the RAMGizmo
board to get it onto the RAM slot... Might have just been my machine, but
who knows... I'm happy and it aint coming out so I do not care...

You should be able to get any standard PC style printer cable and plug it in.
The only problem you might encounter is that the ST grounds pin 34, which on
some printers is the Reset line. A little tape cures that problem. :-)

Later,
Gizmo

4510. GEMini CD and GCC - environmental variables

4511. The Grocery Lister v4.2

Newsgroup: comp.sys.atari.st
Date: 1994-06-12 21:38:50 UTC
From: renfro@bnr.ca
Message-ID: <2tfv9a$ai5@crchh610.bnr.ca>
Source record: 185431

I tried to post this in the announce group, but it didn't work...

Version 4.2 of The Grocery Lister has been uploaded to

atari.archive.umich.edu

See bottom of file for changes in this version.

If you would be interested in translating the resource or docs
to another language and/or collecting registration payments
outside the US, please contact me.

The Grocery Lister Version 4.2
==============================

The Grocery Lister is a household utility program that allows
you to compile a list of grocery items complete with current
price and total estimated cost. The Grocery Lister can be
used to determine approximately how much you will spend at the
store if you know the items that you need, or it can be used
as a budget tool to allow you to select the items you most
need or want if you only have a fixed amount to spend. The
grocery database serves as a useful reminder of items which
you may need as you compile your grocery list. Finally, for
those who have 'errand boys' do the shopping, The Grocery
Lister will generate a very neat and easy to read printout of
the current grocery list.

The Grocery Lister has many advanced features as well as an
easy-to-use, mouse driven, multiple-windowed GEM interface. A
single grocery database file can have grocery item information
including item name, category, location, coupon or sale flag,
a taxable flag, and a price for up to 4 stores. A grocery
list can be created for up to 10 stores at one time by loading
in other grocery database files. The list is then printed
with items grouped by store so you know exactly what to get at
each store. There is also a feature that will automatically
select items from the store with the lowest price so you can
price shop at multiple stores without thinking about it.

The Grocery Lister also has many advanced editing, sorting,
and display options to provide maximum flexibility and ease of
use. For example, the grocery list can be sorted by location
so that items appear in the list as you would find them in the
store. No need to search up and down the list to see if you
missed anything on the canned goods aisle, the items are all
right there in one spot on the list.

The Grocery Lister has been tested on various ST,STe,Mega,TT,
and Falcon machines and runs in any medium to high resolution.
A partially disabled demo version is available on GEnie and
various other on-line sources.

The Grocery Lister also has a flexible pricing structure.
If you already have the demo version 4.2+, you can obtain a
serial number and code key for $15.00. You can also order the
software direct from the author for $15.00 + $5.00 shipping
and handling + $5.00 for a printed user manual. You can
substitute a blank floppy and large self addressed stamped
envelope for the $5.00 shipping charge and/or you can choose
to only receive the program documentation on disk. As a
special bonus, The Grocery Lister comes with a database of
nearly 1000 items!

Write for more information or order your copy direct from:

Randy Hoekstra Email: R.Hoekstra1@genie.geis.com
3414 Norwood Circle
Richardson, Texas 75082

======

* Changes for version 4.2 (6/93):
- Minor improvements in window handling code and a minor bug fix for
buttons in the page set up dialog
- Added registration/demo dialog and support code.
- Can now increase or decrease item amount with shift mouse button.
- Leading blanks are now allowed in item, category, and location fields.
- Moved all alerts to the resource file so the program can be easily
translated to another language.
- Added user configurable amount field. Can now set the number of
digits and whether or not to use decimals in amount field. This
allows for various international currencies to be used.
- Added option to retain item info (category & location) when adding
multiple items.
- Changed to double click to select category & location in item
add/edit.
- Will automatically load previous version 4.x format files.

A friend has just come into ownership of one of these and I can't seem to
get it to work with my ancient hard-drive software. They only let me
format up to 16 megs a partition, is this actually a maximum? or is it
just the limitations of the software? The drive is 105 megs.
There are a set of 8 jumper switches near the i/o connections of the
drive, will these have any significance to anything and if so what?
Does anyone have the correct settings for these?
I've got the details for the drive such as the write comp and stuff, but I
still can't get it to work :(.
Does anyone know anything about these things, and if so can someone help me?
I'd really appreciate it.
Oh btw the host adaptor is a berkeley micro-systems bms-100 if anyone's
ever heard of one of these.
I know I haven't ;). Apart from mine that is.

Thanks for any help anyone can provide,

Paul

Original in boxes w/Manuals:
---Atari 1040STFM color system SC1224 Monitor
---Loads of STart Mags w/disks (remember them?)
---RealTime-Pro Sequencer S/ware & Diablo amd assorted other British mags and software disks.

...will throw in w/ best (reasonable) offer in original boxes (all are midi units):
--Yamaha PSS-680 MusicStation-MIDI
--Casio PMP-500 Pro Series-MIDI
--CZ101 (no box-but w/manuals)-MIDI
--Roland TR505 Drum Machine
--Yamaha QX21 Dig. Sequencer
--AKAI ME20A Dig. Seq. & Arpeggiator

what can I say, I just got a new P5-90 and things gotta go...

Martin

Source record: 185452

After spending, well, let's just call it "several" hours playing Goal!, I have to say that Dino Dini has fixed it sufficiently for me to recommend it wholeheartedly.

Here's a list of what's changed:

* It doesn't crash for no apparent reason any more during a game, or while editing teams. I haven't had this happen once and I'm confident that it won't.

Well, that's really the only important one. But just for the record:

* Teams now appear in the correct strips after a substitution.

* No spurious graphics (e.g. extra balls).

* No stripes on the pitch! I definitely prefer it this way. It makes it a little harder to judge your speed, until you get used to it. But teams playing in green are almost impossible to see on the scanner.

* When one of the computer's players gets "hurt", the correct player is eventually substituted.

As I said in an earlier article, it will crash on 4Mb machines and won't boot under TOS 2.06 (on an STE, at least), but these are minor niggles (with simple solutions) and can't spoil a great game.

Goal! absolutely wipes the floor with Sensible Soccer, not to mention every other soccer game ever. The tactical depth is quite astounding.

Stephen

Source record: 185438

In a message dated 6-11-94, Steven Selick asked:

"What the heck does multisession mean anyway?"

As I understand, it refers to a CD-ROM that has more than one directory. Until Photo CD came out, there was little need for this.

If you turn in film (say a roll of 24 exposures) to have a Photo CD made from it, there is still room on the CD for more. Since the CD used for this application is a write-once media, additional info can be stored on it, but the directory cannot be rewritten. Thus, if you took another roll of film in, and wanted the additional pics added to the Photo CD, another "session" (e.g. directory) would be created.

Note that this by no means implies that all Photo CD's are on write-once or even multisession. Someone selling Photo CD's at the commercial level (such as Corel does) would simply have the data set up for a mass pressing of conventional (non-writeable) CD's. Also, they might have the multiple directories (if the "master" were multisession) converted to one directory, or more likely, all images to be put on the PhotoCD were submitted at once, resulting in a single session to start with.

BTW, did you really have to quote an entire screen-long message just to append a one sentence question to it? (Disregard this if your system's newsreader is so primitive that it can only quote full messages or nothing at all).

June 11, 1994

DMC Publishing, Inc.
Toronto, Ontario, Canada

This morning I received email from a customer drawing my attention to a particularly misleading, and entirely erroneous statement in the latest STReport, even more so than usual. As a rule I ignore Ralph's comments but every now and then he leaves me with no choice but to clarify as his message is so potentially misleading and damaging. This is one of those times.

The following is an excerpt from the SILICON TIMES REPORT, INTERNATIONAL ONLINE MAGAZINE, June 10, 1994, issue No. 1024, Publisher-Editor Ralph Mariano from his column, STReport CONFIDENTIAL.

~~~~~~~~~~~~~~~~~~~~~~
- Chicago, IL NEW "LIFE" for CALAMUS SL??

According to our sources in the European marketplace... Calamus SL, long recognized as a premier DTP package in Europe, is to be supported by a new company, Adequate Systems, having been formed by a splinter group composed of the original programmers responsible for the Atari modules and code. The group broke away from DMC GMBH recently after the announcement made at this year's CeBIT that DMC GMBH would no longer support Calamus SL for the Atari marketplace. It was further reported that DMC GMBH has put all their efforts in the making of the Windows NT version. At CeBIT of 1994 the following happened. DMC GmBH has told their Atari customers, because of the market situation and Atari, we recommend that you buy a system capable of using Windows NT.

This upset many Calamus customers both present and future. Concerned customers switched to the Mac, which was fast becoming less expensive due to repetitive discounting by Apple. Since NT had, so far, proved very disappointing to DMC Germany's expectations, especially after Microsoft announced that it will NOT market the product on a wide scale. NT was NOT the OS to replace windows for your everyday PC and PC Clone.
It was further reported that Adequate Systems, unfortunately, does not hold any of the copyrights to Calamus or SL or any portions of the code contained therein. At this point DMC GMBH is not willing to
~~~~~~~~~~~~~~~~~~~~~~

relinquish any (c) holdings. However it is rumored that Dr. Reidhl, newly appointed to the board of Directors of DMC GMBH and marketing manager, formally of Atari GMBH, is attempting to reach an amicable agreement with the newly formed Atari SL programming group's company Adequate Systems. Hopefully, another Chagall-like episode is not in the wings.

~~~~~~~~~~~~~~~~~~~~~~~

There are so many errors in the above few paragraphs that I hardly no what to say or where to start. Most of it is utter nonsense. Absolutely no attempt was made to contact DMC Publishing for clarification!

As the above paragraphs could be potentially damaging to DMC Publishing, the fact that I was not contacted suggests to me that this was a deliberate and malicious act, by a totally irresponsible journalist, Ralph Mariano, acting out of personal motivations that had nothing whatsoever to do with truth, reality or journalistic integrity, in my opinion.

As usual, Ralph took a grain of truth and distorted it to fit his personal agenda.

Last December, 4 programmers, long-time members of DMC GmbH, left DMC to form their own company, Adequate Systems. It is their published intention to continue to work on additional modules for Calamus SL, for which they have my respect and support. I've known all of them personally since 1987 and I'm certain they'll produce excellent quality product! They have a few modules in the works right now although I wasn't prepared to announce them yet. We are still finalizing the details, North American pricing struture, English translation etc.. I expect to have 3-4 new Calamus SL modules from them within the next 90 days, which is great news for our established Atari Calamus SL customer base. The new paint and drawing module, in particular, should be a major success. It has long been awaited.

Calamus is owned by DMC. There is no conflict in this regard, none!

In-house programmers are currently working on a new version of Calamus SL. Again, I will announce further information on this subject at a later date when it is more appropriate.
An entirely separate team of DMC programmers are involved with the NT version of Calamus. Basically we are talking about different divisions within the same company.
I hope this clarify's the situation for any of you that read this nonsense. Please post my message far and wide to insure that everyone gets the opportunity to read it. I ill post it myself on Compuserve, Delphi and GEnie but I do not frequent the Internet or any more local bulletin boards so I'd really appreciate the assist in spreading the word around. In future, if STReport says anything about DMC, Calamus or myself, please take it with a large grain of salt and contact me directly. I will be pleased to clarify.
~~~~~~~~~~~~~~~~~~~~~~~

Sincerely

: was not successful. Has Derek got an E-mail address? Could be useful
: for advice etc.

: Signed:- A Falcon030 owner, and proud of it! Best machine around, just
: needs programmers!

: Darren Coull

It also would be rather nice to be able to connect an 8-bit drive to the Falcon. There are more options on the Falcon than on the ST, but I'm sure that the printer port would work just fine.

Basically a complete port with any optimizations for the 68030 plus any other improvements that could me made. It would also be nice to have the Player-missile code put back in, remove more of the incompatibilities, and fully support the display list (including interrupts too), making whatever signal changes are necessary in the Falcon's video hardware.

Oh, and get the colors right!

No, it would take two. Everything in Tempus 2 is completely remappable to whatever keys you want. The mouse is optional.

> Tempus also doesn't have CMODE or WRAP modes; CMODE makes my C/C++
> programming faster, and WRAP makes my news posting faster... ;-) Oh,
> and did I mention the macro language? I love MicroEMACS...

Tempus 2 does have a wrap mode. However, it does not have a C parser built in, nor does it have extensive macro capabilities. Still, MEMACS does not even come close in terms of speed, window flexibility, font control, etc. etc. More importantly, all of its power is accessible without the rather steep learning curve that any of the EMACS variants demand. A total novice can be completely comfortable with its drop down menus, window structure, dialogs, etc. So, if a touchie-feelie text editor is desired, Tempus 2 is very difficult to beat.

I am a Neodesk person myself, and I have not experienced this bug. I have noticed that I cannot seem to get the program to default to the current directory for extraction (even when what appears to be the proper button in the Extract dialog is set), but this is a minor problem. I am using a MegaSTE with TOS 2.06. Perhaps an auto folder or ACC program is causing it?

That said, I am amazed at how fast Lharc 3.10 is.

Source record: 185454

I tried to run Llamatron over the weekend for the first time on my
Falcon. It wouldn't work and I was sure it would. Can anyone
tell me how to set Backward so that it runs? Does it run?

Whatever happened to Llamazap too?

Yes, I *always* got this - it is probably something in the AUTO
folder. Suspect everything...

The 68000 CPU talks to itself in 32 bits, while it talks to
the outside in 16 bits - the design of the 680x0 range of chips
seem to be much better, and more complex, than Intel chips.

You can tell if a person is a programmer or a hardware person by
asking him/her if the 68000 is 32 or 16 bits. A programmer may
say 32 bits while the hardware person would say 16.

Interesting eh? :)

: Have you got a solution to this?

Hm... it's true, you have to be careful in using ACCs with GFA-Basic. I recommend to hold none of the CPX modules in RAM. I also have had some problems with screen accelerators and screen blankers. If you use some kind of Bootup configuration programs (like XBoot) you can easily make a special GFA environment.

Sorry, I haven't made any experience with GShell. There is another fine GFA shell called "Ergo Pro!" - this is running well.

Ciao, Heiko.

Source record: 185460

You don't say what version of the ST225 you have,I assume it is the SCSI
one.
This is a 21 Mbyte, 65 mSeconds access time drive.
There should be address & parity jumpers located to the right of the 50 way
SCSI connector, might look like this >>> : : : :
(The figures are my addition) P 4 2 1

I am not familiar with your host adapter, but I believe that it does not
use
parity. The 'P' jumper selects parity, remove this. The others slect the
address of the drive, if it is the only drive connected, remove all these;
if there are other drives, you will have to determine their addresses &
select an unused one.
If you want address 3, remove the '4'; if you want '6', remove the '1'.

Your ST will only see this drive if it is working.
If your TOS version <= 1.02, then you can only format 16 Mbyte partitions.
If your TOS version >= 1.04, then you can format up to 32 Mbyte partitions.
(Unless you get newer drive software).

The FRONTIER: ELITE II demo runs on the Falcon, so I'd assume
the full game does (doesn't require Backward or anything
either!). I just wish it were Falcon-enhanced! I'd DEFINITELY
buy it then, but I still might buy it w/ only 16 colors.

Since hi-res (640x400) True Color mode is only available in interlace
mode, a standard ST RGB monitor (SC1224/SC1435) will do fine. For mono,
an ST mono monitor will do fine. A great general purpose monitor for
the Falcon, though, is an NEC 3D -- you'll just need the proper cable
adaptors/interfaces!

Hi

You may get it from

micros.hensa.ac.uk
under
micros/atari/tos/n/n122/

Please note that this is the latest version with English Documentation,
which is supported by Joe Connor in this country (UK). Please also note
that HENSA is the official site where Joe uploads the latest versions
of his software. So if you want the latest versions, then log into
HENSA.

I see that you are in the ac.uk domain.....anyone lse like this may
apply for free registration and membership of the HENSA atari-falcon,
atari-tos, and atari-mint newsletters. If you want to join, then mail
me at:

danny@micros.hensa.ac.uk

Cheers.

Danny.

For old Commodore hardware (64, 128, PET, Vic20...): comp.sys.cbm
For Amiga hardware: comp.sys.amiga.hardware

I'm not sure on the ST, but I believe Paint Shop Pro for
the PC/Windoze will load in IMG (and other formats) and save in a
number of them, including PCX. I know it works with standard black
and white IMG's (I was viewing some of the IMG's on the Gemini CDROM
on the PC at work with it), but I dunno if it can handle the
extended (X)IMG's...

Can be found at wuarchive.wustl.edu (where many cool things,
Atari and not, can be found :-)

I dunno, considering the state of the home computer industry,
perhaps ST should mean "Still Ticking"? (or at least TOS anyways :-)

> tell me how to set Backward so that it runs? Does it run?

Llamatron is fast and frantic on a Falcon030 although it does require Backwards. From memory the settings are:

1Mb+ RAM
16Mhz 68030/16Mhz Blitter
All TOS fixes on
sound mode - correct

You must run it from ST Low res and it's probably a good idea to turn off the hard drive and run it from floppy.

4564. ANNOUNCING FALCON SAMPLE EDITOR

Newsgroup: comp.sys.atari.st
Date: 1994-06-13 12:05:39 UTC
From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <1994Jun13.120539.16785@cen.ex.ac.uk>
Source record: 185481

Appologies if this is a duplication but I am under the impression that my
attempt to post it failed before. It really belongs in comp.sys.atari.announce
but doesn't seem to want to go there...

```
**********************************************************************
** **
** S U P E R S A M **
** **
**********************************************************************
** The Superb Sample Editor v1.01 **
**********************************************************************
** A Terrosaur Systems Production for the Falcon030 **
** (C) Copyright 1994 by Daniel Hastings **
**********************************************************************
```

SuperSam is Shareware!
To enable the program's full functionality you must send the
registration fee to the author.

What is SuperSam?

SuperSam is a sound sample editor for the Falcon030.
A sound sample is a digitally stored sound. Hence with SuperSam
you can digitally store sounds on disk, and edit them in a variety
of ways including reversing them to play them backwards, cutting
and pasting, combining multiple sounds and many more functions.
SuperSam eventually aims to be able to do anything you could
possibly wish to do to a sound sample.

Features

SuperSam has many features including:

* Handles 6 sample file formats
* Handles 8 bit mono, 8 bit stereo and 16 bit stereo samples
* Clipboard cut, copy, load, paste, replace, overlay
* Ability to import/export from the GEM clipboard
* Ability to sign and unsign samples
* Ability to fade in/ fade out samples
* Ability to boost volume by 25% or to the max possible
* Ability to reduce volume by 25% or to zero
* Ability to zoom in for finer editing
* Flexible deleting
* Ability to swap the channels on a stereo sample

* Ability to pan the stereo image left to right or vice versa
* Ability to edit only the left or right stereo channel
* Ability to shift sample playback frequency
* Ability to create samples from the MIC input
* Supports all Falcon playback frequencies
* Customisable
* Can be installed as an application to play samples when they
are double clicked
* Will play or load a sample dropped on its desktop icon
* Online HELP system
* Batch conversion between file formats
* Jukebox mode to play all samples in a folder
* Fully GEM legal programming
* MultiTOS compatible
* Dynamic Memory Allocation

SuperSam has been uploaded to atari.archive.umich.edu, ftp.uni-kl.de,
micros.hensa.ac.uk and ftp.funet.fi and should appear in the appropriate
directories soon. It is also being distributed through NeST and uploaded
to CIX. Spread it!

Frontier does work on the Falcon but requires you to boot up a bare machine (no ACCESSORIES or Resident programs) and to have a disk in Drive A. Also, don't press TAB!!

Has anyone noticed that the soundtracks play faster on a VGA monitor than they do on a TV.

Source record: 185484

CEO file contents:
Hi,

I was thinking about getting myself a Falcon. Is there a FAQ somewhere about this machine ?

I'd like to know the general specs, the graphical modes, what sort of connections you have ? Does it use SIMMs for memory expansion ?

I've read that you can badly crash the machine when you fiddle with the NVRAM and that you need a special program to boot it up again. What is this ?

What about 2.8" disk drives ? What are they worth ?

I've also read that you can connect an SC1224. Well, I'd like to do this as I haven't the $$$ to get a VGA yet, but where do you plug it in ? The SC1224 has a special ST plug (DIN-like, but with 14 pins) that the Falcon doesn't seem to have. Where can you get an adaptor ? Or should I rather plug it in the TV ?

There was also a text file with the compatibility status of most ST games. Does anyone know where it is ?

Last but not least (putting on the asbestos suit...), is the Falcon a really good choice as a serious general-purpose computer ?

Sorry for so many questions. Thanx in advance :)

Bye,
Nick.

There are many graphicsmodes with different colors and reses plus interlace/non-interlace. It also emulates all the ST modes. Additionally you can buy third party devices to add additional graphics resolutions very cheaply.

It doesn't use SIMMS unless you add a 3rd party SIMM board. The built board is proprietry and to all intents, non-expandable.

Standard SCSI 2 connections, standard RS232 and paralell. No external floppy or ACSI connector. 2 ST joysticks, 2 STe joysticks, 2 midi sockets and an appletalk.

|> I've read that you can badly crash the machine when you fiddle with the NVRAM
|> and that you need a special program to boot it up again. What is this ?
You should never need to touch the NVRAM. It just stores the nationality, date format and other such details. Once set, that's it. You also set PAL/NTSC and default graphics mode mode. I never touch it and haven't even looked at it since I bought my Falcon nearly a year ago.

|> What about 2.8" disk drives ? What are they worth ?
Don't know. Not much else uses 2.88 so hardly worth it. I believe the AJAX chip supported 2.88 so I guess the Falcon probably does.

|> I've also read that you can connect an SC1224. Well, I'd like to do this as I

|> have. Where can you get an adaptor ? Or should I rather plug it in the TV ?
You use a short cable thatterminated in either a VGA connector or an ST connector. These are cheap ie 10GBP each. SC1224s are OK to begin with but you'll end up blink very quickly as most useable reses will flicker. Best get a cheap VGA or SVGA or better yet a multisync ASAP.

|> There was also a text file with the compatibility status of most ST games.
|> Does anyone know where it is ?
Not sure. There is a program called Backwards that makes most games work on the Falcon by making the Falcon look like an ST.

|> Last but not least (putting on the asbestos suit...), is the Falcon a really
|> good choice as a serious general-purpose computer ?

If you already have an investment in Atari hard/software then probably yes. I must admit that after a year I have outgrown my Falcon and bought a 486 PC. I'm a professional software developer though and this is what forced the issue as I needed to learn stuff that is only available on a PC :-(:-(

Most ST software works fine. I have tons of it built up over 6-7 years and all the apps bar one worked fine - VIP Pro was the guilty one. Most PD works fine. There are huge amounts of good quality Falcon PD and most major applications have been made Falcon friendly or Falcon enhanced.

If you do buy a Falcon, NVDI is a must have and so is a screen enhancer like Blowup and an SVGA IMHO. Otherwise you're strangling the machine. Why use a 640x400x16 interlace screen when you can have 900x700x16 or 256 non-interlace??? More screen space is essential with MTOS or DTP/WP type stuff.

4572. Microprose Golf on the Falcon! :-)

Newsgroup: comp.sys.atari.st
Date: 1994-06-13 13:01:39 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <2thlbj$psc@nyheter.chalmers.se>
Source record: 185487

As of 1 PM last night, Microprose Golf now runs on the Falcon!

Microprose Golf has been my favourite game since it came out, (I'm ranked as number one in the world, of course ;-), so I've been rather annoyed that it wouldn't run on the Falcon. I've tried before to make it run and actually wrote a C program to handle Golf's file system last year. I never got close to having it running then, but yesterday I took another look and found a small bug in my file loader. When that was corrected I could run the intro sequence without crashes from hard disk. :-)
Of course that was only as far as Golf would run when auto booted before, so it was no big improvement. It made it much easier to try out some fixes for the rest, however.

It turned out that all the problems in Golf are related to the same _bad_ programming technique, mainly in the sound routines:

```
subroutine move sr,-(a7)
move #$2700,sr
...
rte
```

It's disturbing that the programmers at Microprose don't know more about the 68k or have more sense. The code in the example above would have worked fine if the last rte had been replaced by:

```
move (a7)+,sr
rts
```

Unfortunately there was no room in the code to add that, so I had to disable the sound.

It might not be too hard to make Golf hard drive installable, but it would be _very_ difficult to load tracks from or save results to anything but the ordinary disks. The problem is that most of the code is position dependent and loads at interesting places, for example:

```
$1000 Sound code
$4800 Main program
```

This will overwrite many memory areas used by the operating system and would make it impossible, I think, to use a hard disk after the program is started.
Why can't they _ever_ learn!!! :-(
(Well, I guess they have, a little. Civilization runs from hard disk without 'backward' if a few OS calls are removed, the sound disabled and some mixups in the keyboard handling fixed. I've heard that a later version runs on the Falcon, though. Elite II runs if you're very careful about what auto programs and accessories you use.

Apparently I'm the only one who've ever had any problems with Elite II, but
that's only because every one else is _very_ lucky.)

Now, the reason for this post is not to announce to world that the patch
program will be uploaded to atari.archive tomorrow(;-), but rather that I'd
like to hear from some Falcon/TT users who have Golf. It would be nice if
all the potential problems could be sorted out before the patch is released.

I've played the first nine holes on 'Fenham Valley' without crashes, but the
speed of the 'strength meter' makes it rather difficult to get a straight
shot. I guess turning down the clock to 8MHz would solve that, but it would
of course be nicer if the timing routines were fixed.

Anyone who's interested in testing the patch program, please mail me.
If you think you could help fixing whatever problems there are left, _please_
mail me immediately.

By the way, has anyone got Epic (another favourite) to run on the Falcon? I
know it says in the compatibility list that it runs, but mine certainly
doesn't. After some twiddling with the 'backward' settings it gets as far as
the initial screen draw, just when I'm about to start flying, but then it
hangs. It's probably a trivial bug, since it detects the '030 at start up and
the intro runs fine.
If no one else is already working on it, I'll probably have a go at Epic
during the summer, but it would be nice with some help.

Perhaps someone could convince all the cracking groups to start producing
Falcon fixes for the most popular programs? They certainly have the people
and equipment to do it. :-)
I guess it'd be more realistic to get together a group of people on the
internet, however. How about it all you fellow hackers out there? ;-)

Maybe this Neodesk bug is only showing up in TOS 1.62? That's what I use and it is there only when you run the shell with the Unload to execute flag set.

Another thing I have noticed which is VERY annoying is that some archives will not extract using the shell - reporting back an "garbage in file" error but when I extract them using the TTP version or even an old version of LZH they work fine!!!

Anyone else confirm this with version 3.10??

The answer is NO!

Neodesk 4 is almost finished from what I've read in ST Review and it
looks good, an improvement over the excellent version 3.

In fact one of the Neodesk programmers is on the GEM mailing list
if I remember correctly so they are still going strong.

We are still here and busy trying to finish NeoDesk 4. I apologize for the delay, but we decided to add some last minute features (including Windows Icon support and SpeedoGDOS support) which delayed the release a little. Right now, as I write this, I am trying to finish its manual.

What do you mean by getting no response? Our 413-247-5620 number is open 10am to 6pm, weekdays, Eastern Standard Time. There's always someone there to answer your questions, check on the status of your order, etc.

Whenever possible we've gone out of our way to not cash any checks or charge any cards until the product is ready to ship (The major exception being people who bought multiple products with one check). If you have ANY questions, please feel free to call our office or to write e-mail to this address or to "gribnif@genie.geis.com". You can also send us a fax at 413-247-5622.

Rick Flashman,
Gribnif Software

Yes, and you can selectively save/not save backup.not backup files as you
go. All without using the mouse. (I rarely used the mouse in several years
of using Tempus)

>Tempus also doesn't have CMODE or WRAP modes; CMODE makes my C/C++
>programming faster, and WRAP makes my news posting faster... ;-) Oh,
>and did I mention the macro language? I love MicroEMACS...

Tempus does autoindent, which is 99% of CMODE (8)) as well as parenthesis
balancing, and it also does autowrap.

As well, you can record and save macros.

On the down side, it runs under GEM.

Mind you, MicroEMACS is worse. It certainly doesn't run properly on my TT
under a vconsole (assumes 80x50 screen, when I have 160x60).

I use jove, because I don't have enough memory for 'real' emacs. Unfortunately,
jove doesn't seem to grok next-buffer 8(

> cherborth@semprini.waterloo-rdp.on.ca

Ahh, editor wars 8)

Well, there is a bit of a programming problem. Many of the demo programmers
use someone else's module-playing routine which sets the volume beforehand!
:-)

Anyway, the latest Lazer demo allows you to change the volume beforehand.

Michael.

Source record: 185499

I started using my 1040ST again after many years. I purchased it over seven years ago, used it as a smart terminal in college, and started using it for internet access a few months ago. I have a few questions since I have to learn the "lingo" all over again (for the ST):

I have an internal DS/DD drive, a medium rez monitor and 1 meg in memory.

1. How do I hook up a hard drive? I seem to remember that STs came with a DMA port built in. Do I just hook it up and get software? Can I use generic Seagate drives? I need detailed info.

2. What is the best comm program for the 1 meg ST w/o a hard drive. I am currently using Uniterm and, sometimes, Trapido. Is there an English version of Trapido? I need a comm program that supports 14.4k modems. I am currently using an Avatex 1200 baud modem, but a U.S. Robotics Sportster 14.4k is only $150 from Computer Discount Warehouse. Is this an okay modem for the Atari?

3. Can I expand the memory with generic chips? (i.e. $50/meg) Where can I find special chips/boards if they are necessary?

4. Is there a FAQ for the ST? Where can I ftp to get it?

Thankes, Anupam Razdan, raz@mcs.com

4587. ST Format: Quark (On Cover Disk)

Message-ID: <1994Jun13.153506.8623@ultb.isc.rit.edu>
Source record: 185355

In my never ending search for a good multi-track sequencer that plays 16-Bit *.AVR samples through my Microdeal Replay 16 on my 1040STF with optional MIDI support (I don't have any MIDI anything yet and simply want to sequence my samples and play the results through my Replay 16 Cart), I happen to run across ST Format Issue 58 with a program called Quark on the cover disk. This program actually looked like it might be what I've been looking for all this time, especially since it was made by Microdeal. Unfortunately, the store only had one copy and I assumed someone ripped the cover disks off because all the other magazines that came with disks had their disks attached. I searched a few more stores in Buffalo, NY and then every store I could think that might have it in Rochester, NY to no avail. I decided to go back to Buffalo and stop back at this store to see if they would sell me the disk-less magazine at a cheaper price. Unfortunately, they now had issue 59 in stock with a Quark Player on the cover disk instead. *sigh*

Can anyone give me more information on this program called Quark from Microdeal? Is it what I've been looking for the last few months? If so, anyone have a cover disk they want to sell me? :) Thanks......

You need either an Atari specific SCSI HD or an adaptor to a SCSI drive. I'd
recommend the latter. There are various interfaces that go between the ST and a
HD. The most popular is 'The Link' from ICD> There are several others though. The
'Link' turns the STs ACSI interface into a proper SCSI one so you can attach any
standard SCSI device like HDs, CD-ROMs etc.

|> 2. What is the best comm program for the 1 meg ST w/o a hard drive. I am

|> $150 from Computer Discount Warehouse. Is this an okay modem for the Atari?
Try 'Connect'. Nice and fast and configurable and cheap too! Remember that a
standard ST can only go to 19,200K though unless you start messing around with
the hardware.

|> 3. Can I expand the memory with generic chips? (i.e. $50/meg) Where can I find
|> special chips/boards if they are necessary?
Depends on the ST. You will be better getting one of the many SIMM adaptor boards
and then using SIMMS to go upto 4Mb (The 'normal' max memory on an ST.

|> 4. Is there a FAQ for the ST? Where can I ftp to get it?
Yes there is. Not sure about an FTP site. It turns up here regularly.

Is there some program, or set of integrated programs, that could
replace my various versions of various archivers? At the moment I have
to use a different program for each type of compression, and some
archived files seem only to like being unarchived by a particular
version of an archiver- I have 2 different Lharc programs, for instance.
Even a single program that would give me a nice front end to
make selection quicker and easier.

Duncan.

Too bad. I know you are wildly enthusiastic about this program. What is
ASspeed, BTW?

> This is why I wan't to stick with some thing that I know works...
>
> Flash 1.6 with GSZRZ....

How about Connect with GSZRZ and Selectric, which should allow you to do
multiple file uploads with no problems? Connect has built in support for
GSZRZ, in addition to its excellent internal Zmodem. It also works perfectly
with NVDI and HSMODA04. Be sure to get version 2.46, and the update for
the Zmodem stuff. They both exist on atari.archive. Another alternative
would be Uniterm, which can support GSZRZ with a minimal set of macros.

Strange, it works fine for me as an installed application, both from Neodesk
and the TOS 2.06 desktop. It sounds to me as though it might be sensitive
to auto/acc's or something, as the error reports seem to differ wildly.
I am running a MegaSTE, NVDI, HSMODA04, BeforeDawn, Paula, Chameleon,
Xcontrol 1.31, Pinhead, Universal Item Selector 3, and I don't seem to have
any major problems.

Here you go. I didn't write this, but I seem to remember building one and
it worked.

--begin included text--

Some games, such as Gauntlet II, allow four player
to play at once. Here are the pin assignments for
the cable. You need two female 9-pin plugs and
one 25-pin plug (don't remember if it's male or
female).

Joystick 3 Parallel Port
----
1 6
2 7
3 8
4 9
6 11
8 25

Joystick 4 Parallel Port
----
1 2
2 3
3 4
4 5
6 1
8 24

Parallel port pins 18-25 are all connected to ground.

I haven't tried building this myself, so I don't know if
it will work. Good luck!

4600. New price on monitor

Newsgroup: comp.sys.atari.st
Date: 1994-06-13 17:22:24 UTC
From: magnum@realm.tdkcs.waterloo.on.ca
Message-ID: <magnum.4vm7@realm.tdkcs.waterloo.on.ca>
Source record: 185346

I've changed the price on the monitor for a quick sale...

Atari SM-1224 Colour Monitor in new condition. $50

Other stuff...

Yamaha RAM card for SY and TG series synthesizers. $20

Korg MONO POLY analog synthesizer. $300

Dragon's Layer for the Atari ST. $10

Atari ST Serial Port MIDI expander...C-Lab, Steinburg and Dr. T compatible to give you an extra independant 16 MIDI channel port through the serial port. Works with: Creator, Notator, Cubase 3.0, Realtime, K.C.S., Multi and any program that supports the C-Lab standard. $20

All prices do not include shipping and are in US dollars.

There are a number of archiver shells out there. Check out the index on
atari.archive.umich.edu for some samples. I have heard good things about
two-in-one, but I cannot seem to locate the English version (which is claimed
to exist). If someone can help me find it, I'll stick it on atari.archive.

>You must run it from ST Low res and it's probably a good idea to turn off the
>hard drive and run it from floppy.

Those settings sound correct, Basically you just have to change one or two
things on the setting from the "lowest compatability" setting. But, you don't
need a disk, mine runs perfectly from the HD... and since I have a VGA monitor,
it just FLIES!!! At least 2 times the old speed.. it's great!

oh yeah I think it will run from Medium rez too, but if you stick to low then
you will be fine.

>>other soccer game ever. The tactical depth is quite astounding.

>Hi Steve! Nice to see someone's got a working version of "Goal!" at last!

>Michael.

Actually the fixed version has been around since January/Febuary. But as usual Virgin have not exactly gone overboard to let people know about it. The problems were fixed as soon was possible and everyone who wanted it replaced has had it replaced F.O.C.

My appologies for the problems with the first version... one crash was due to a limit on some BIOS versions on the number of memory allocation calls you could make, and the other was an interupt problem that caused rare crashes and took me a long time to track down. I nor Virgin were aware of either of these problems when the game was originally released.

Should anyone have any problems getting a replacement, let me know.

Best Regards,

Dino Dini

4614. Link for Sale

Newsgroup: comp.sys.atari.st
Date: 1994-06-13 19:45:52 UTC
From: osteele@u.washington.edu
Message-ID: <2tid1g$6c4@news.u.washington.edu>
Source record: 185368

I'm selling a Link, with DMA cable (both brand new it's a duplicate), software (for Link), and a custom cable that'll let you plug the Link directly to a SCSI drive (to the 50 pin block rather than needing a case or cable with the 50 pin Centronics connector that the Link needs).

I also have ICD Pro Utilities.

So far I have an offer of $80 for all of the above (Link stuff and Pro Utilities), but I will take any higher offers. I will also be willing to split the items up. E-mail ASAP if interested.

> >real reason that MultiTOS is still not a patch on MAG!X .

The AES is the main reason why MultiTos is slow - If you run without it (ie
INIT= shell or something) my STE is really fast.

Any windowing system uses lots of CPU but in the case of the current AES with
MultiTos things are worse :-(

If Atari release AES 4.10, MultiTos will become much easier to use :-)

> Mag!X is faster than AES 4.10 and is much more reliable. It features both
> cooperative and preemptive multi-tasking, switchable at any time. You can

> AES 4.xx features, but at least it works.
>
> ------------------------------
> Ofir ogal@cix.compulink.co.uk
> ------------------------------

While I have to admit that Mag!X is probably faster than MultiTos, and this is
still probably true for AES 4.10 I am curious as to what MiNT/AES system calls
it supports.

MiNT is effectively mini-UNIX and supports pipes/devices/loadable file systems,
etc, etc .... The AES part of MultiTos also has a few new/different calls
(I'm not too sure what these are though)

How much of these does Mag!X (or any of the others) support ??

MultiTos has it's problems (as does Mag!X or any piece of software for that
matter) but Atari has decided that it will take this as it's standard
multitasking OS which provides certain features to the programmer. If the
other competing multitasking systems do not provide these features then
they could end up being incompatible with some programs.

I'll leave the rest of my crusading support for MultiTos/MiNT
to another day, 'cos I better do some revision now.

Bye for now,

Andrew.

4616. For sale: Magnavox Color Monitor for ST

Newsgroup: comp.sys.atari.st
Date: 1994-06-13 20:32:13 UTC
From: tipi@vivaldi.acc.Virginia.EDU
Message-ID: <CrCrpp.LLo@murdoch.acc.Virginia.EDU>
Source record: 185379

(pardon the double-spacing:my ancient CPM laptop is fussy)

Magnavox 8cm-515 color monitor w/ custom cable for Atari ST.

Better than Atari; 13" (vs. 12), sharper pic, better made,

use with IBM-comp's, Amiga, and composite-video machines

(Atari 8-bit, C=64, VCR, laserdisc player) as well.

640x240, analog & ttl-rgb, & composite-video & green-screen.

* Includes $40 custom 8' cable for Atari ST; separate sound

jack for running sound thru stereo.

* FANTASTIC picture when used w/vcr or ld as hi-res tv; better

than any tv-set! Ideal for one needing both monitor and tv

in a small space. Can even have BOTH on and switch between!

Excellent condition.

$200 or best offer. Call (804)295-9995 or

send email to tipi@vivaldi.acc.virginia.edu

Hmm, actually rlogin connects to unix (or at least BSD) fine
with net 0.42. When I first tried, I used 'slattach localhost unsane'
rather than 'slattach unwashed unsane' on the other machine. When
rlogin didn't work, this just confirmed what the README file
predicted. I still don't understand the ping problem though.

I have a friend (no, really!) who wishes to find out whether it is possible to disable the cache on the cartridge port of a Mega STE only, rather than disabling the cache as a whole.

I apologise if this is a FAQ, but I normally don't read this group. If responses could be directed by email, I would be grateful, and will gladly summarise if required.

Many thanks,

Dave.

I've been willing to ask the following for a long time from a "real" ST commercial games programmer: _why_ aren't even the new ST games Falcon 030 -compatible..??? What is the reason? Why almost all Amiga games work on A-1200..4000 range, today mostly even with enhanced graphics, etc - but almost nothing works on Falcon (at least without ST-emulators like "Backwards")..?

The point: is Falcon _so_ different that it's impossible or difficult to write code that works both on a humble STFM, and F-030? Or is the truth this: Atari market is so small that programmers and/or game publishers simply don't care?

I can hardly say, how ultimately angry I was to find out that my favorite game of all times, MicroProse Formula One GP didn't work on TT/Falcon, wasn't hard disk installable (5 disks... ;-|), wasn't upgraded with the better PC/Amiga conversions - and so on... And _that_ ST-game sold well over 50.000 legal copies. Sometimes I really feel like we Atarians are treated like some damned fools. Do commercial game makers believe that we use our 520 STFM systems for a while - and then upgrade to a PC or Mac..? So Falcons and other speedier beasts don't exist at all..?

Sorry for bitter words, but it really hasn't been a joy to be an Atari Falcon owner wanting to play games..! We would buy, pay - but what..? Our money goes nowhere, because only Silmarils seems to care about our pennies (Ishar 1-3, Robinson's Requiem, Transarctica). I believe that for some really good games there would be a profitable Falcon Games -market (e.g. Sim City 2020, Falcon 3, Indy Car Racing,...). But it seems like nobody's interested.

And that's a shame. How about Goal! ..?? Is it Falcon compatible?
Thanks for any good opinions, whether things'll change, or not!
Let's not bury this issue; we _need_ new, good Falcon games..!

Greetings, thietavuo@abo.fi

Your ball is held by a "rubber band" stretching left and right. It's quite tricky to build up the right velocity in the right direction to hit the intended positions. Match symbols to go to next level. Oxyd and oxyd2 are rather frustrating to beginners, but worth some time&effort to master.

>
>Nonsense, you don't need to pull them up. They can be left open. No problem.

They just burn out (hopefully unnoticed) but they can take the other chips
with them in their graves... Please pull up ! When connecting a high
impendance scope onto these not connected terminals you can see what
happens. Try pointing with your finger toward the pins.... The input swings
up and down with the frequency of the mains..
The unconnected chips can become quite hot when left floating...

greetings,
Gert

I just had a friend download the latest greatest ICD software from Genie.
It is version 6.4.3. This is the non-Pro level stuff. I mention this
because it is often unclear what the latest version is. I'm hoping that
I will be able to work something out with ICD such that atari.archive
will be the official ftp site for ICD software updates.

I've been using 5.6 heavily for a project I'm working on and am constantly using Alt-Shift-S to save the file I'm working on. It works just fine 99% of the time. I do get a file selector every-so-often, but I've attributed it to not holding down the Alt key hard enough.

4629. Re: Spool Hand, Luke

Newsgroup: comp.sys.atari.st
Date: 1994-06-14 01:12:23 UTC
From: rrice@netnews.upenn.edu
Message-ID: <2tj05n$6r5@netnews.upenn.edu>
Source record: 185385

To All Concerned:

Well, the beast has been tracked down and I'm glad to say that he's experienced a sudden, precipitous decline in the state of his health.

To refresh everyone's memory, I was getting mysterious checksum failures every 4K on my Z-Modem file downloads from Penn's system to the Atari, which reduced my transfer rate on the U.S. Robotics 14,400 Sportster to around 410 cps. This was with v.42bis on both ends, and the HSMODEM04 patches installed.

It was NOT the Serial Port buffer in my Mega 4 STE's set-up. On Dan Wilga and Rick Flashman's advice (both of them Gribnif and they and their company can use me as a reference ANY time) I altered the size of my serial buffer and ran some tests. That BackTalk script driver for STalker to do that was a nifty idea, and it made the whole thing easy. That's the first BackTalk script I, programming yutz big time, have managed to make useful. I've had no luck writing my own, but, anyway...

I had to change my preference setting to run that script, since for some reason my BackTalk buffer was unaccountably small! B^) It was then that I noticed that my FILE TRANSFER BUFFER was also set to 4K... Talk about a coincidence!

And that, children, was it. I still get those weird Checksum errors whenever Penn's system fills my file transfer buffer, but with that set to 50K as opposed to 4K, I'm now getting upwards of 1500 cps transfers, which I've been told is about the best you can expect from Penn. For special occasions I might sock the file transfer buffer up to the max of 127k, but I can live with the 84% efficiency I'm getting now.

Cheers to Mickey Boyd, who gave me some great advice, to Gribnif in general for great software (and if you don't have STeno with STalker you've cut off your left hand), Messrs. Flashman and Wilga in particular for great customer support, and jeers to Penn's HELP people who never got back to me, and to U.S. Robotics, ditto.

On the projects list--to get ambitious and run some experiments with HSMODEM04 and my "Serial 2" port on the Mega 4 STE, since I am currently very much too poor to fill that slot with one of Gribnif's Crazy Dots II graphics cards.

Take a bow, all you good guys out there.

>Harvard Graphics, etc, but you can pretty much write-off any of the
>newer, "cooler" software, as most *require* at least a 386...

Most of the software emulators used by stuff like SoftWindows
emulates '286 code. Of course the CPU is much faster than any Atari,
but the truth still holds.

I contacted them about the addition of the Cyrix '486 replacement,
they assured me that their '486 version was going to ship
very soon. This was over six months ago.

So, when you look at all those software PC emulators out there,
only a couple work off of '386 emulation, and still today about 40%
of all the software out there is compiled for a '386 or less.

Not that I dont totally agree with your message, the FalconSpeed
really needs a boost to a '486. The Cyrix, AMD, and TI chips are
quite powerful now, with DX implementation and soon to come
Pentium clones... it will be interesting to see what happens.

From: abarbiero@delphi.com
Message-ID: <Z26tnzo.abarbiero@delphi.com>
Source record: 185388

F-16 Falcon will not run on a computer which has TOS 2.0x or greater. Flight of the Intruder has the same problem. MegaSTe/STe with TOS 2.05/2.06 will not work. Same for TT030 or F030.

There are several hacks out there that will make Falcon work on these machines, but they are illegal to distribute.

A description of what to edit/change would not be!!

Does anyone know of a source for RS-SPEED by Stephen skrodzki or RSVE by Harun Scheutzow? It is a hardware add-on for the ST to allow faster baud rates by replacing some of the little used slots (60, 300, etc) with hi-speed routines and such. It's mentioned in the documentation for HSMODem3 and Connect.

RSR> 19,200 baud, 8bit, no parits, one stop bit.

Check your settings in the modem so it using RTS/CTS.. It sounds like a RTS/CTS problem. You can also try to change the buffer size in RBUF and TBUF in MFP.PRG in the HSMODEM package.. Then you use SETTER.TTP in the same folder as MFP.PRG and click on SETTER.TTP write MFP.PRG on the commandline and then you can change the settings.. You can also check so you have first DRVIN.PRG last in your auto folder and then MFP.PRG last.. I'm using HSMODEM04 on my board here with a DTE speed at 38400 with my V.Fast Class 28800 Bps modem with no problems at all..

I've used the hp550c on an IBM and it worked very well. But I recently got a Canon BJ600 which has great output, (360x360) possibly not as high resolution as a 600DPI printer, but the color is really good. I use pagestream 2.2 which has a set of drivers for itself. Canon recommends drivers for their printers and one of them that Pagestream supports is the LQ2550c driver. This works great except for one thing. The printer thinks it is working with longer paper than I tell it to print on. On 8.5x11 paper, I have to print at 95% size, and if I print more than one page it goes farther down to start on each successive page. Also, my other programs print out the same way. Even STWriter. Maybe something is wrong with my printer. Any Ideas?

When it says "insert data disk and press any key" (or something like that),
insert a formatted, un-write protected disk. Should work - I've had no
problems. That way disks A, B, & C can stay write protected.

Hy there,

I'm using GFA-Basic 3.5 D and I don't have any problems with
CPX-Modules or ACC's. The shell I'm using is called GFA-Shell,
quite nice, runs well even with MultiTOS (but GFA-Basic doesn't
really).
I'm running GFA-Basic in something like 664x832.

Vektor has many restrictions in its vektor export (rather ironic for a vector program!). Gradient fills are not exported properly in CVG format, and are not exported at all in EPS format. The only way I have found to guarantee that you get what you expect is to output as a bitmap (ie TIFF). Of course, this bypasses one of the advantages of vector art...

KL> Ques #1: Can some one tell were GFA is located? I believe in Mass..some where
KL> and also what version of GFA basic is curent, and how about upgrading
KL> from 3.05 (e I think)

I think GFA is now located in Hamburg, Germany. Don't know
if they're also in the US.
GFA-Basic is no longer supported by GFA, it is now under support
of Richter Distributor, Germany. They are working on a Version 4
called Basic 4.0, as far as I know the interpreter is running
but the compiler still doesn't even produce "Hello world".
I'll call Richter again in some weeks to get the latest information,
but at the moment due to the low Atari market, the developing
is really creeping.
A yes, the newest version is GFA-Basic 3.6 TT, with some bug fixes
on the TT. The 3.5E version (newest 3.5 version) seems to have
more bugs than the 3.5D version, but I'm not shure about that.

At least you should trp update to 3.07d which has some bug fixes.
The 3.5 version has some new functions (matrix operations).
The BEST thing is: you can fold functions like procedures.
(You don't want to miss this if you've ever feeled it...)

You need to run LLAMATRON in 8MHz and from ST low-rez compatibility
mode.

LLAMAZAP still hasn't been released, but according to Atari Corp.,
Atari U.K. is arranging to distribute at least 3 Falcon games via
one of the European software houses (STEEL TALONS and, I believe,
HUMANS/DINO DUDES are 2 of them -- there are a few other Falcon
games Atari was working on, though, including LLAMAZAP (which Jeff
Minter said was completed in October 1993), ROAD RIOT 4WD, SPACE
JUNK (this may have been scrapped before it was finished), and, I
believe, RAIDEN).

4661. MiNT V1.10

Newsgroup: comp.sys.atari.st
Date: 1994-06-14 10:34:56 UTC
From: dmh1@ukc.ac.uk
Message-ID: <8467@merlin.ukc.ac.uk>
Source record: 185319

would it be possible/sensible/legal for someone to compile me a
copy of MiNT v1.10 (is that the latest released pd version that is
only supplied in source?) for an STE? I don't ahve a HD so I thought
it isn't possible for me to use GCC, is this true?

I've got v1.04 at the moment and running Multitos,NVDI and SeBra it is
painfully slow, how can I speed it up? replace the AES? I'd use a
shell instead I suppose, has anyone got any recommendations for shells
that are useable from a floppy drive?

I'm also using CoNnect and it has screen widths of 79 chars, I can't
seem to get it up to 80 which is what my terminal is
can anyone help?

cheers.

4663. pascal compiler for ST ??

Newsgroup: comp.sys.atari.st
Date: 1994-06-14 10:43:52 UTC
From: hhakkine@cs.joensuu.fi
Message-ID: <1994Jun14.104352.995@cs.joensuu.fi>
Source record: 185320

This may not be the correct group ? But probably the best one :
Do you know any cheap pascal compiler to work in an old ST with
520 K and TOS 1 ?
It would be used only for easy exercises and need not be anything
fancy. But cheap enough for that use.
If you know, where could I get it from ?
Hannu.

F1GP runs on a Falcon with Backwards only requiring sound to be set to correct
mode and the caches off. It takes advantage of the extra CPU power to produce
a higher frame rate.
Annoying that it isn't HD installable, but it does work.

> Let's not bury this issue; we _need_ new, good Falcon games..!

True, but unfortunately we appear to be stuck waiting for good shareware or
freeware rather than commercial games...

LE> Err.. i think you will find ARM stands for Acorn Research Machines.

OK, I'll try and clear this up. ARM did indeed stand for Acorn Research machines. Then, for some reason (possibly due to a lack of money) the two companies split, and ARM now stands for Advanced Risc Machines. Both Acorn and Apple own stakes in ARM.

The affiliation between Acorn and ARM has always been close, and Acorn is nearly always the first manufacturer to get the new chips into a machine.

ATB,

Martin

>CAn anyone tell me what sort of FALCON specific (commercial) software
>is available?
Not surprisingly, most of the Falcon-specific software is audio stuff; after all, it's only the audio subsystem and DSP that makes the Falcon significantly different from an ST or TT. A lot software which runs on STs can make use of the improved graphics of the Falcon, of course, but then they're not Falcon-specific.

Audio software starts with toy stuff like Clarity Falcon and Musicom, up to the biggies like Cubase Audio and Notator Logic Audio. Many people also use the shareware WinRec. On the non-music front, there are a few voice mail packages due out soon, and there is a shareware one out there now somewhere.

Graphics programs often run on an ST, but only come into their own with a Falcon (or TT+graphics card), eg DA's Vektor and Picture. Both are excellent, although the former has a few strange quirks in its import/export capabilities. And both have documentation that varies from non-existent to shite.

As far as I am aware, there is very little non-audio software that makes use of the DSP yet. You are already familiar with JPEGD; this can be used by GemView. I would have thought that the DSP would be usable for image manipulation too, eg the filtering in DA's Picture, but I have yet to see any software using it such.

Was you using HSmodem 4 during these problems..??

Me thinks you may have some thing that is slowing down your system,
may be a TSR/ACC or Mint/MultiTOS...

I have found some TSR's that can slow things down a lot, there is a speed
program that can test for this, I have it some ware on my hard drive, when
I find it I will post the info here...

I don't find Stalker that fast at all, the Zmodem that I use and I think is the
Best is GSZRZ, my version is 4.4 but there is 2.88 around..

Also you could try Connect, seems faster than Stalker, Stalker is old by
to-days standards...

Totally out of date. Jeff did a couple of very successful shareware games on the Atari ST, started work on a game for the Panther console when Atari stopped development of it. He then wrote Llamazap for the Falcon, and has recently finished the awesome Tempest2000 for the Jaguar. He is working on a new lightsynth, as well as doing something secret with the man who used to be known as Prince.....

Hope thats some help.

Brian.

: Was you using HSmodem 4 during these problems..??

Eye Wuz.

: Me thinks you may have some thing that is slowing down your system,
: may be a TSR/ACC or Mint/MultiTOS...

Conceivable--I have View II installed and a pretty full auto
folder. On the other hand, I download to the CodeHead Ram disk using my
blitter for faster action...

: I have found some TSR's that can slow things down a lot, there is a speed
: program that can test for this, I have it some ware on my hard drive, when
: I find it I will post the info here...

Might you send SPEEDOM to the Michigan archive? Then we all
could use it.

: I don't find Stalker that fast at all, the Zmodem that I use and I think is the
: Best is GSZRZ, my version is 4.4 but there is 2.88 around..

I tested v. 2.88 and got very little improvement, also finding it
as user-friendly as a Great White shark. The incredible convenience of
STalker/STeno for day-to-day Internet communications is mind-boggling.

: Also you could try Connect, seems faster than Stalker, Stalker is old by
: to-days standards...

Connect froze on me, kept re-setting to its defaults when I'd get
it configured, and did not seem to offer $45 worth of improvements over
STalker, not that STalker couldn't use a few upgrades itself.

: Sorry I had to post this, as I can't mail you, error follows..

: Although this is excellent news at first glance, I can't help wondering if
: there aren't some worrying aspects to this. If Atari are allowing free binary
: distribution of MiNT, it suggests to me that they aren't even considering
: releasing any new versions themselves in the future => no new versions of
: MultiTOS => no publicly available AES 4.1. Could be unfortunate - I just hope
: I'm wrong!

Even if they don't release any future (Multi)TOS versions, and if
they decide not to release the new AES 4.1, it still is good news
that everyone, not just compiler gurus, will have access to MiNT 1.11.
And even have it for free.
And *if* Atari drops TOS development altogether, I'd consider it to
be an intelligent move if they place the whole TOS, including AES
and so forth in the Public Domain, or protect it with some kind of
Copyleft. That way, the worldwide internetworked Atari community
could pick up TOS development, which *might* create an enormous boost,
if things gather speed like they do with Linux.

Ok, I know I'm probably dreaming....

Did it not work at all, or did it have problems? If the latter, and if you
have a printer attached to your machine, you should turn the printer on,
and set it offline before booting Gauntlet II. This will prevent it from
creating a third player automatically (this is due to the 4 player parallel
port feature, which does not like printers that are connected but not on or
on and online).

Personal Pascal, formerly by OSS, then by ICD, now defunct, might work off
512k. Prospero Pascal (a significantly better compiler) probably won't,
nor would Pure Pascal (I think this was released). Those are the only
Pascals I know of for the ST.

Personal Pascal is a fairly common item on the used market here in the
states. I don't know about Europe though. Hope that helps.

Simply get some utilities that allow you to work with 720k IBM PC formatted disks on the Mac, and you will be in business. You need to have a Superdrive on the Mac, I believe (any 1.44mb drive is a Superdrive). Depending on the version of System you are using, you might already have what you want. For example, Apple File Exchange can read/write to PC disks in 6.0.x, and I think with System 7.x you just stick the disk in and it works.

Formatting the disks on the Mac may be a bit more difficult, but I'm sure there are small DAs or utility programs that can do this. My suggestion would be to format the disks either on a PC or an Atari system. I personally use ps2form.tos to format PC disks on my Ataris, even though the later versions of TOS can do this from the desktop. Ps2form produces the most PC compatible disks I have used (they even work in some NEC PCs I have which don't accept most floppies formatted on _other PCs_).

4681. How do I register Gemview

Newsgroup: comp.sys.atari.st
Date: 1994-06-14 18:53:00 UTC
From: cybercube.research@canrem.com
Message-ID: <60.48522.4514.0N1A245D@canrem.com>
Source record: 185347

-> I've been using Gemview for a while, and I'd like to register it. Is
-> it possible to do that here in the US? I'm not keen on sending away
-> to Germany to do it, and I thought I saw some talk here indicating
-> there is a US distributor.

Yes there is. You can register your copy of GEM-View through Cybercube.
We have a special arrangement with Dieter Fiebelkorn and handle all the
North American registrations of GEM-View for him.

Price is US $29 plus $1 for shipping and handling. Please send your
cheque or money order to:
Cybercube Research Ltd.
126 Grenadier Crescent
Thornhill, Ontario
L4J 7V7, Canada

-> Please include the correct price, and if it comes with a manual; is
-> it on disk, or will it be e-mailed to me?

We will send you a registered copy of GEM-View, with your own personal
access code. You can copy all the files and give them to a friend, we
just ask you to keep the registration key confidential.

You can also find printable registration forms for GEM-View on GEnie or
CompuServe (called CyReL Time$avers).
They can save you a lot of time and you just have to fill in the blanks.

[...]

The reason is I'm afraid, that the Falcon market is even smaller than the ST
market, and GOAL! only just made it to ST at all. In fact I doubt I have made
any real profit out of it taking into account the development time.

>The point: is Falcon _so_ different that it's impossible or difficult to write
>code that works both on a humble STFM, and F-030? Or is the truth this: Atari
>market is so small that programmers and/or game publishers simply don't care?

I don't know how similar the Falcon is to the ST. And the Atari market is so
small that it is not worth supporting for most developers and publishers. It's
not a matter of not caring... that is emotive language... it's a matter of
buisness. I do sympathise with your position, and also have no plans to
support the Falcon in the future and am unlikely to support the ST again.

[...]

>Sorry for bitter words, but it really hasn't been a joy to be an Atari Falcon
>owner wanting to play games..! We would buy, pay - but what..? Our money goes

>there would be a profitable Falcon Games -market (e.g. Sim City 2020, Falcon 3,
>Indy Car Racing,...). But it seems like nobody's interested.

If the market is not there, I certainly am not interested. Developing games
for a living, I have to go where the money is to some extent. There come a
point when the return does not justify the work, and for the Falcon that is
the case. Sorry.

>And that's a shame. How about Goal! ..?? Is it Falcon compatible?

I don't know... I have never seen a Falcon. I use ST OS calls, but access the
screen directly. If Atari maintained backward compatability, it should work.

If not, it won't.

GFA in the US is located in Salem, Massachusetts. 800-766-6GFA.
The latest GFA BASIC version for the ST is (still) 3.6 which has only minor
changes from 3.5.

>
>Ques #2: I am looking for a good FAX program with ZOOM v32 (14.4) modem, one

> mode and the caches off. It takes advantage of the extra CPU power to produce
> a higher frame rate.

You're partly right; it does run with above mentioned settings - but not very healthly.. =-(First, the frame rate does increase, indeed - but unfortunately, so does the _overall speed_ of the game..! So, the game loses its realism; it's too quick! Time flies: a lap of let's say 1.10 minutes in computer time is (in reality) only about 55..60 secs. So, the whole game runs too fast - which makes it unrealistic and for some people also difficult to play! But think about the forthcoming 68040 accelerators for Falcon... If F1GP has such problems with 16 MHz.. It'll be totally unplayable in faster, accelerated Falcons. Does anybody want that? No, I guess..
The frame-rate should be adjustable, as in the PC version. Also, that game would get new kick from DSP support. If anybody was interested... ;-(

> Annoying that it isn't HD installable, but it does work.
>
> > Let's not bury this issue; we _need_ new, good Falcon games..!
>
> True, but unfortunately we appear to be stuck waiting for good shareware or
> freeware rather than commercial games...

One problem is this: we have been mentally slain. Just listen/read people's comments on this kind of issue. "Let's forget it - it's our destiny - stop dreaming.. they'll never make those games for us". Disbelief has spread so widely that the whole Atari scene is rotting from inside. Dark, gloomy, over-"realistic" attitudes rule.
We _will_ be stuck, if we ourselves surrender - and in my humble opinion, might as well then change to Macs, PC's or even Amigas. Maybe games-makers don't care - and we don't care. So who does? Anybody sharing my thoughts?

> support the Falcon in the future and am unlikely to support the ST again.

I'm sorry you feel that way - but thanks for your opinions! I understand what you mean - but there are a couple of things I disagree with:

1) What does good reputation mean to a games producer? Many software houses have started with ST - only to abandon it, when some more profitable systems have come to existense. Point: _more_ profitable. I really doubt many games makers lose money with ST games (especially: good ones, like Civilization, Kick Off, etc.). In reality, a well money-making ST game has been kicked off by e.g. more money making Amiga version. This leaves, however, very many people with ST (or Falcon, etc.) computers VERY disappointed!! And those (maybe even over 50.000 potential customers) who feel abandoned without good reason, won't most certainly think very friendly towards a firm that they helped to grow - but who doesn't care about them later. That simply feels very cold - and unfair. Even if it is pure "business".

2) I feel most of you in the business hardly know what the Falcon is - and fail to see its value as a "Atari of tomorrow". Yes - ST is old-fashioned now - and that's exactly, why me - and very many others - have upgraded to a much better computer. I fail to understand why you (business) support the old, disappearing machine - when there is a steadily growing new market already existing..?

3) This is very strange, I think: as there are well over 50.000 Falcons sold, and the direction on sales is increasing - AND we ALL thirst for non-existing games... Isn't that a MARKET without competition, or what..?! Falcon games market is so "hot" - people WANT games, but don't get them - that ANY games maker, offering a good (even relatively cheap PC/Amiga-conversion) new game, will (!) sell a lot! Because there are very few competitors (unlike in the PC world..!), even this small (yet) market can make profit. And besides, it would create good reputation, too..

4) It would be much simpler for programmers to make Falcon conversions from e.g. PC games, than ST-conversions. This is simply, because Falcon is much more PC-like with 256/256.000 color SVGA graphics, 64k color "True color" capability, 16 bit stereo sound, faster CPU, etc.. Programmers wouldn't have to make difficult compromises (reduce colors, resolution..), but instead take

their existing PC graphics as they are..

So, I hope you had interest to really think about these thoughts - because I feel that if games publishers _knew_ Atari Falcon - quite many might decide to give it a try. As long as you say: "we don't know about the machine, and therefore won't even think about supporting it.." - nothing gets better.
I hope that you, Dino, became[B at least a bit curious to find out about the Falcon - and its features..! Maybe you'll create a mother of all football games - running in glorious 65.000 color screen, utilizing DSP, 16 bit sound, etc..? That's reality from the hardware side.

Maybe you will - and we here hope you will!

> If the market is not there, I certainly am not interested. Developing games
> for a living, I have to go where the money is to some extent. There come a
> point when the return does not justify the work, and for the Falcon that is
> (NOT) the case. Sorry.

The market is here. Only where is the game? Goal! for Falcon.
Who said we Falcon-users wouldn't play football..? ;-)

> I don't know... I have never seen a Falcon. I use ST OS calls, but access the
> screen directly. If Atari maintained backward compatability, it should work.

Copy protections cause lots of harm: they usually stop working on a faster Atari, and mess up the machine. There are hardware and OS differencies too, quite a few - but nothing impossible to handle, I believe..

Thanks for your answer once more, and good luck with game-making!

Greetings, Tommi.

: > MASSIVELY accelerate graphics, then it would be acceptable. There is LOTS

: I've got my doubts that this would be feasible, since the '030 and the
: Falconspeed board sit on the same bus, and only one of them can control it.

: If you are running the 386 board, then the '030 is basically just sitting
: there and unable to do anything.

: Later,
: Gizmo

This seems reasonable, but how is it that they are able to report highly accelerated graphics? The only way to do that is to have another processor handle it, and everyone knows that the DSP can't access main RAM.

: -scott tirrell
: -stirre31@maine.maine.edu

I know about the drive adapter. I have one. Of course, it never worked.
<shrug> Maybe it was because I was using it on a Mega ST.

Right here in my hand, I have a disk on which is written, "Xformer Source". I don't know which version it is, and I think it's rather old, but I'll see if I can get it to you. I suggest, though, that you get all of the source you can from Darek, including PM graphics, etc. The developer's going to have to really do some work to make a REAL Falcon version. Don't just hack it to make it work... optimize it and add things to it. Make it MORE compatible. The programmer should become as intimately familiar with the design of the 130xe as was Darek when he wrote the Xformer.

Add a Jump scroll, if you don't already have one. Do it kinda like xterm does it. Be sure that when it jumps, it doesn't jump more than it needs to because many things will be position sensitive. I have an implementation of that sort of thing that works, so you can talk to me if you need any help. Basically what you need to do it get scrolling and drawing speed up to the point where it can handle 57600 full tilt with scrolling without getting behind.

Yes, as a matter of fact, there are. Contact pdirect@delphi.com for information about Processor Direct magazine. It's a very nice, well designed magazine for Atari computers, with focus on the newer Falcon and TT machines.

The address is

Two Worlds Publishing, Inc.
3837 Northdale Blvd. #225
Tampa, FL 33624

In the US, the cover price is $3.50, and the subscription price is $25 for 12 issues. They can also be contacted by phone. Ask for the phone number.

You certainly can. Only problem is that of types of transfer you
accomplish.
I used interlink on ST and zterm ont he Mac for this.
Great for text files, but a mess with others.
If you run an emulator Spectre.... etc. you can run them via the comm
port using same zterm program and get very efficient service.

Hello and thankyou for reading this post.

As stated in my previous and very long :(post I am desperately seeking
Atari magazine sources, Programming books, technical documents, etc.
anything to do with programming the Atari. I will accept information
concerning any Atari computer or video game system both new and old. I
plan to compile a listing (sort of a FAQ) and post it here for all to
see and will keep it up dated as long as I get new things to add to it.
Please email in the following (or any suitable) format:

For Magazines:
o Magazine Name
o Address (for subscription)
o Subscription rates
o Phone number
o type of Atari(s) covered (or type of programming covered,
i.e. M68k, C, Pascal,etc.)
For books:
o Title
o Author
o Publisher's Name (if available)
o ISBN
o Price (if available)

For Online-tutorials:
o Ftp address
o Directory
o Filename(s)

For telnet sites, gopher, www, etc:
o IP address
o Login:
o Pass:(if needed)
o Also instructions on how to find info,
subscribe etc. (if available)

Miscellaneous sources (Mailing Lists, Compuserve, Genie, etc.)
o Anything that isn't already covered
in AEO online for FAQs.
o For mailing lists
- Email Address & how to subscribe (if possible)

And anything else you feel is pertinent.
With ftp sites please send anything that is not covered in
the FAQ or clearly specified as having programming info.
Thankyou very much.
Email Submissions to: jonewby@unccsun.uncc.edu or jonewby@uncc.edu

Does any one know why Gauntlet II doesn't seem to work on my STE.
Originally own an STFM (tos 1.02) and it worked fine, then bought my STE
(Tos 1.62) and it wouldn't
work at all. Would get to the title screen and then crash as loading
continued. Both machines have 1 Meg.

Martijn, You might be satisfied with a program available on Delphi called Launcher. i believe it does what you are looking for.

If you are itching for a program to write, how about an item selector program that allows for long filenames as well as 8.3.
~ Stephen mountainair@delphi.com

Mickey's answer is the correct one, if your primary criteria is 'cheap'.
You might also find it marketed as ST Pascal+ from CCD out of Germany.
It's a good system (and I used it for a number of years) but you may
find it rather slow and/or clumsy on a half-meg system. I always used
it on at least a one-meg ST, with ~400 kB allocated to a RAM disk,
since the development shell repeatedly pulls in the compiler, linker,
editor, etc. With only 512k you might do a lot of disk swapping, or
fall back to using a command line shell. Also, version 1.11 was some-
what smaller and faster than v2.05, as I recall.

For something a lot more workable in your cramped memory environment
you might want to consider HighSpeed Pascal. It's more expensive
(generally going for around $120 US at Toad, etc.), but since the
whole thing is memory resident with an integrated development en-
vironment (shell, editor, compiler, linker, libraries, source text
and object code) it will be much, much faster and less painful,
with extremely fast turn-around cycles.

With your limited memory, you will have to forego the context-sens-
itive hypertext help, and skip the GEM interface libraries. But
you should be able to write and test small to moderate TOS-mode
applications. I think a minimum usable HighSpeed system can be
trimmed back to about 200 kB (plus space for source & object code).

HighSpeed Pascal is distributed in Germany, Switzerland, and Aus-
tria under the name Maxon Pascal, by Maxon Computer GMBH, at In-
dustriestrasse 26, D-6236 Eschborn, Germany. It was developed
by D-House in Denmark, at 1 Aps, Transformervej 29, DK-2730 Herlev.

I believe Hisoft has distribution rights for the rest of Europe.

It's mostly compatible with Turbo Pascal (v5.0), but not as much so as Pure Pascal (which is a fair bit larger, and I think, out of the question under your constraints).

It's been a long time since I used Prospero Pascal, but I think 1-meg would be a minimum requirement. There's also Alice Pascal and UCSD Pascal, but I can't tell you much about them. And another defunct option is Metacomco Pascal, also depending on a large number of separate tools, tied together by a rather crude shell.

Lastly, there's Gnu Pascal, which is way too big (and possibly incomplete), but it is free, which certainly meets your 'cheap' criterion! :^)

hi

I am looking for a good C compiler for the Falcon... Please recommend
shareware and/or commercial programs I should look into. Are compilers
processor specific (ie: can an ST compiler run and compile on an 030)?

Sorry if the question sounds silly but I am just starting to code.

later.

: Also you could try Connect, seems faster than Stalker, Stalker is old by
: to-days standards...

Connect froze on me, kept re-setting to its defaults when I'd get
it configured, and did not seem to offer $45 worth of improvements over
STalker, not that STalker couldn't use a few upgrades itself.

CoNnect does exactly this if you use it longer than the allowed testing
period. I think, this is a legal limitation for a user who tries to use
the program illegally.

If you think the price difference to stalker is $45 you should check the
different prices once again.

[...]

>Greetings, Tommi.
>(Turku University of Business and Administration)

There must be, I don't know for sure, 3 million Amiga's worldwide? I'll guess
at that to make my point.

A top game on amiga can sell probably 80,000-100,000 copies. A phenominally
successful game might double that. So lets be generous.... 200,000 copies.

This is all rough, but good enough to make my general point, and here it is:

An absolute "no one should be without this" game can capture around 6% of the
Amiga floppy based market. 6% of the Falcon's 50,000 potential customers is
3000 copies. As a developer I can expect a maximum (for a game retailing at
about 30 UKP) of around 2 UKP a copy. So the whole deal is worth 6000 pounds.
The conversion is likely to take 3 - 6 months, for which 6000 is not a lot.

And please bare in mind that is guessing favorably. It would probably be a lot
less.

I know there are various arguments that you will want to put forward as to why
the share would be higher than 6% on the Falcon... but It's all guess work.
Producing a game for the Falcon would be a gamble... too much of one for me
I'm afraid, and one where the stakes are high for not a lot of return.

Yes/yes/no. :-) For better or worse (I think for the better) Atari/ers
have restricted MiNT to being available in source only.

You may be able to use gcc if you mess around with a big ramdisk. You
could also use Lattice C or Pure C to build MiNT.

There are already 2 file selectors that do that (you need MiNT, of course...). Well, 1 and a half: the latest version of Selectric (> v1.10) is not out yet, but is reputed by the beta testers to allow it. The other FS is called MFSFM, and is ftp-able from the usual sites.

: Although I have found that its doesnt like most of my Fli files :(They
: play fine on Fli_play.ttp. Have you had any problems??

Most FLI/FLC utilities don't create a valid FLI header (i.e. DTA on
the PC). They forget to set a bit (bit 0 at offset $e, from the beginning
of the file. Just look at a valid FLI file: Byte $e should contain
1 or 3, while ugly programs set it to 0 or 2. Take a disk utility, and
set this bit. Everything should then play ok.

BTW, the new version of this player is finished. It now handles MPEG
files too (Falcon only, because DSP needed). It's not released just
because I don't know how to release it: freeware, shareware, or
commercial.

So far I have yet to hear fo a MagX version that runs on the Falcon. And
until we have that, I really don't see it as much of a contender.
At least Multitos so far works on allAtari platforms, as I think, does Geneva.

It sounds like the printer thinks it's set up to use A4 paper, which is longer than US 8.5x11 paper. I don't know the printer, but I imagine there must be a set of DIP switches to set up this sort of thing? Take a look at your manual...

yes, the GUI needs a certein degree of knowledge of its philosophy
to be usefull. It is very fast and easy to use once you learned this
and even better when you are an expert.

>Having said that I hacked away at it in the dark and couldn't make it fall over
>either so it look's like it's pretty stable !

> WK> So could anyone comment on this new OS? Wheter or not is really
> WK> does speed up the ST 8.25 times?

it may speed up certain OS function by this factor, but remember
a cprog doing a large sort can't be much faster on the same CPU.

... And what kind of software that is
> WK> available for it? Does anyone know if anything by GNU is running on
> WK> it? Or POV?

some GNU text and compiler tools, the c compiler itself is non GNU
ANSI and K&R. Porting GNU stuff is very easy.

not very much desktop publishing stuff, a nice spreadsheet, a database
engine (server) and lots of tools. No big apps.

>The software looked pretty limited ATM , My opinion is that it is a real
>amazing piece of hardware that will be of no use whatsoever to the majority of
>ST user's but the OS freak's will love it as it is VERY 'interesting' in that

it would be usefull once that application is running on it.

> WK> One other thing if those specs are correct, it would seem logical
> WK> that fitting such a unit to a TT (or even better a Medusa) would give
> WK> you a Cray at home :-)

it may take some time before it will be available on TT or medusa,
but it runs with some 68030 cards.
If it is at least as fast as QDOS (should be!!!) that would be very
fast. Remember - Sinlair QDOS used a 7.5 68008 to get real
multitasking and I can still work with it nicely (GUI ...)

Bye
Richard

You can get 640*480 in case you monitor syncronizes at 23kHz line-freq.

FastSer is Freeware and no longer developed. But it works fine on all
known ATARIs with SCC serial port (MSTE, TT, FALCON).

> Are there are any English docs available? I if so please, Email them
> to me. If not could you have someone outline the setup for a TT030,
> with TOS 3.06, and the before mentioned modem.

I don't think there are English docs available. Just put FAST_SER into
the AUTO folder. If you use CoNnect and/or GSZRZ, you should try
FASTXSER instead.

Since FastSer is no longer developed I won't recommend the use of it,
because HSMODEM is much better now and it comes with an English
documentation. Use CoNnect 2.46U and HSMODA04 for best performance
with your ZyXEL plus. You'll need from atari.archive:

connect_2.46_english.lzh 338 v. 2.46 of this excellent comm program
connect_2.46_german.lzh 351 same with German docs/menus
connect_2.46_update.lzh 215 update to fix internal Zmodem bug
hsmoda04.lzh 89 Good serial port fix, ST's to Falcons, German/English

Bye,
Knarf

I should have been more specific. I apologize for that. It loads and displays the intro screen with the four characters and also plays the music, but then it just hangs (I think I got bombs but I am not sure). I have to move my ST to the tv and connect the external modulator, so I do not have a printer connected when I play games.

Erlend.

P.S. I do have a logitech mouse connected, does that matter?

>than they do on a TV.

A lot of times, music routines are tied directly to the video --
since a VGA monitor has a higher refresh rate than ST RGB/TV,
that would explain why.

Message-ID: <1994Jun15.121445.18139@city.ac.uk>
Source record: 185298

Hi. I want to use STO Maestro to loop a sample (only about 128 bytes long) but since my copy is from a coverdisk I don't have the syntax.

Someone (from the STOS mailing list) sent me a description of how to do a single sample, with the looping done by just repeating it, but the timing is critical and hence I'd much rather it was looped by Maestro.

Maestro (from looking at the extender file) seems to have a command called samloop, but I don't have the syntax. Can anyone help? TIA.

Hello,
A friend one mine,who has got ATARI MEGA ST2,complains
about his HDD,which doesnt work any more.So You cant
boot from HDD. After booting with a disk you see the
icons of the folppy drives, but there is no hard disk
icon present.
We even tried to format the hard disk,which didnt work.
The message we got was something like "no hard disk
found" or no harddisk present. So if someone knows how
to solve this problem or what to do or if you have any
idea about that,so please please let us know about it.
You can even send your email to arash@cslab.tuwien.ac.at.

Could it be a Hard disk crash?
Thanx and bye
Arash

There should not be the Need for a Ram disk, the other thing that is very
usefull is a Boot Util, I use Xboot3, I can then have sets of the programs that
TSR's,ACC and CPX's, I need to run that Application, then you don't overload
your system with unnecessary TSR's/ACC ..

When I have any problems with a program, I just reboot and select
the minimum option with Xboot, its that simple...

>
>: Also you could try Connect, seems faster than Stalker, Stalker is old by

>STalker, not that STalker couldn't use a few upgrades itself.

Why not try Connect on a Simple system, with out all the TSR's ACC, etc,
just the HSmodem4....

There is a patch program for the Later version of Connect 2.46, and note:
you don't have to pay for it, you can test it for one month..

It does work, and with GSZRZ...

>
>7.50 including VAT.

From the prices that I have seen here, its dear by NZ standards..

My GEnie costs are $16nz per month, with 4 hours connect time included, 2400 bps...

A Internet site here charges $52nz per year, and 7c per Mega Byte for e-mails FTP....

The site that I am on, is more or less free, but does not have direct FTP, has Gopher and IRC, its run by the Wellington Council on old redundent DEC equipment, only has 2400 bps, 16 lines and 3000 users..

We don't get charged for local phone calls here...

Food for thought....

There is a lot of hype about Internet in the News Papers here and TV and Radio..

I have done this at 19200 solid for hours with binary files, and it worked perfectly. Zmodem is Zmodem, after all. It is certainly possible to transfer any kind of file with a proper null-modem setup. I was using Zterm on the Mac, and Uniterm (with GSZRZ) on the ST. I've also done quite a bit with PC<->ST null modem (this was in the dark ages, before I got my Syquests). Interlink is pretty old, perhaps it does not do high-speed stuff correctly? Or perhaps an RTS/CTS bug fixer was not installed on the ST?

> If you run an emulator Spectre.... etc. you can run them via the comm
> port using same zterm program and get very efficient service.

One of the irritating things about Spectre 3.0 is that the serial port stuff is buggy. This might be due to a lack of an RTS/CTS bug fixer built within Spectre (I'm just guessing). Anyway, based on the kinds of errors I see while online via Spectre, my guess is that native ST software will work better (I know it will work perfectly). That said, I've never done a null-modem with Spectre, but if it gets random errors on a modem line....

Hmmm, unless the Logitec does not plug into the normal ST mouse port, it
should not matter. However, you might try unplugging it and giving it a
try. Other than that, I cannot think of any reason why your ST would not
like this game. It sounds like it is the correct vintage.

4746. Re: GOAL! - buy this game

Newsgroup: comp.sys.atari.st
Date: 1994-06-15 14:17:06 UTC
From: nj1@ukc.ac.uk
Message-ID: <8494@merlin.ukc.ac.uk>
Source record: 185158

I've read this thread with interest, and here are my thoughts for what it's worth....

According to Bob Gleadow a few months ago, there were 80,000 Falcons in Europe (according to an ST Review interview)... Now, I know a lot of these would be in music studios and the like, but that's still quite a large amount. I know by comparison to other platforms it is still small, but it is there...

Now, Simarils have established a method of converting PC games to the Falcon - it now takes them only about one month - so that is not much of an initial outlay for an extra market, but still companies decide not to bother because they could make more money else where. That's business, but it is killing a potential market before it has opened up....

Have a look and see how many PD games have been downloaded from FTP sites, although I admit a lot of these games do tend to be a bit lacking in gameplay (an art lost a long time ago). Still, I hope a lot more Falcon owners decide to take the bull by the horns and produce some games of their own - besides, games produced by enthusiasts tend to be a lot more playable (Jeff Minters games for example)...

Come on, give the market a chance. Even Microprose were suprised with the amount of copies of Formula One Grand Prix they sold to ST owners....
And before you say 'Oh piracy is a big problem on the Atari platforms', it is a problem, but nowhere near as big a problem as it is on the PC platform, where you are more than happy to sell games with no copy-protection whatsoever....

I do have one other gripe - compainies say 'Oh no, the ST market is dead, so we won't produce this great game for it.' The next thing they do is bring out a tired old platformer - the ahem... 'latest' license - and try to sell that. When they find it doesn't sell (because its rubbish) they claim that the ST market is dead and so on..... Around we go again....

Sorry for letting off steam here..... I just had to say my peice.

Neil.

Their Finest Hour is a Lucasfilms game, right? If so, I believe that is the one a buddy of mine raved about for several months. He thought it was great, YMMV. I haven't heard of the other two.

I would be most grateful for any recommendations for Atari ST
educational software. I am particularly interested in Maths
and English for the age range of 6 to 12 years.

Alternatively, does anyone know of a supplier for the ADI(?)
range of goodies?

Any feedback is much appreciated,

Nige

Although I don't have a F030 myself, I tend to think their owners are more
appreciative of stuff that works on their platform. I say this because more
than half of the registrations I received for my game, Winglord, were from
Falcon owners...Obviously I couldn't program it specifically for it, but it
was certainly in my best interest to make it compatible, and it wasn't even
all that difficult. Huge scale programs like F1 would obviously take more
effort, but I think that it would be worth it for those people that took
the risk. The individual attention that would have to be given to the program
could also allow gameplay to improve, which can only be good; it is lacking
in a lot of programs.

4761. C++

Newsgroup: comp.sys.atari.st
Date: 1994-06-15 16:18:20 UTC
From: millert@undergrad.csee.usf.edu
Message-ID: <2tn9kc$lto@mother.usf.edu>
Source record: 185174
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

The first C++ "compilers" were actually converter programmers that translated C++ code into obfuscated C code that would then be fed into a regular C compiler. I need such a beast for my Atari. I need something that will only do the translation but will not turn regular code compatible with my compiler into something incompatible.

I know there are such programs, because they were the first of their kind and I've seen people discussing them before. Where can I get one of these converters? Doesn't one of the Gnu programs do just what I'm asking for? I'd prefer C source to the converter so I can turn it into a resident program I can use with Lattice C.

Thanks.

4762. ST/Falcon software market (Was: GOAL! - buy this game)

Newsgroup: comp.sys.atari.st
Date: 1994-06-15 16:19:48 UTC

Source record: 185172
Cross-posted to: comp.sys.atari.advocacy,comp.sys.atari.st

CEO file contents:
Hi Dino,

Perhaps 50000 Falcons doesn't make a _large_ market, but there must be
a few million STs out there. Not all users have switched to another platform.
And if the Falcon was correctly software supported most of these users would
upgrade to Atari's Big Bird.

Now, my point is that it can't be _that_ difficult to make your
software ST/STE/Falcon compatible. Now, is it really _much_ more work to just
add to this Falcon sounds/graphics ? DSP stuff and Falcon-only could come a bit
later.

Now look at whats happening on the Amiga. LOTS of people are stuck with
A500s or even A1000s, and there are the new 600s and 1200s with new chipsets.
Do you think developpers are considering 1200s as one single market ? They
just make there software range-wide compatible, and sometimes AGA enhanced.

Can't we just do this. The Falcon is not a market YET. The Atari range
IS a quite big one. Go and ask Konami/GameTek how many Frontier copies they
have sold in the "dead" ST market. Same for Civilisation, and probably soon for
Cannon Fodder.

Put out good ST/Falcon compatible games and they WILL sell for more
than 6% on this software starved market. This figure is for the Mac/PC flooded
market. It just CANNOT apply to a market where user are enthusiasts.

Come on, keep supporting the Atari !

Bye,
Nick.

Message-ID: <C3028.94Jun15183838@rsls4.sprachlit.uni-regensburg.de>
Source record: 185176

Hi!!

I have got Elite II running on my Falcon. It is installed on my internal
HD but I am booting my System from Drive A. Auto-Folder is: fpatch2, ahdi
Accs: just xcontrol because I want to turn off the internal speaker.
(Yes I know, I should kill this beast.)
My problems are:
1. E II doesn not know of Drive F, where it is installed (because D and E are
Minix Partitions?).
2. E II looses Systems. After some mission I go back to map F2 and there are
substantially less star systems. Somtimes I lose the system where I am.
When I try to get a mission for a lost system from bulletin board, there
is only the button "Hang Up".
3. Also the Galactic View (F10 in Galactic Map) is always corrupted.

Any remedies? :-(
Thanks

In article 18349@abo.fi, THIETAVUO@FINABO.ABO.FI (Tommi Hietavuo TKKK) writes:
>
> I really doubt many games makers lose money with ST games (especially: good
>ones, like Civilization, KickOff, etc.). In reality, a well money-making ST
>game has been kicked off by e.g. more money making Amiga version. [...]

A common misconception, Tommi. Just because a company develops a successful
game on a more popular platform does not mean it is cheap or even economically
viable for them to develop, test, package, advertise, market and support the
same product on the Atari.

>2) I feel most of you in the business hardly know what the Falcon is - and fail
>to see its value as a "Atari of tomorrow". [...]

Unfortunately, the "Atari of tomorrow" (Falcon 030) is still far behind the
technology currently offered by other brands of machines and offers little
advantage in the way of price, software availability and support.

> [...] I fail to understand why you (business) support the old, disappearing
>machine - when there is a steadily growing new market already existing..?

Simple economics... there are a LOT more ST owners than Falcon owners out there.

>3) This is very strange, I think: as there are well over 50.000 Falcons sold,
>and the direction on sales is increasing -

Oh, please! WHERE do you get your information from? This is rose-colored hogwash.
Eiuwww. Not a very pretty sight, come to think of it. :) Some UK magazines have
been promoting this deception for some time now and it's ludicrous. Actual
production figures are far below this (no, I won't divulge it) and further manufacture of
the product is not currently scheduled. Does that give you a hint?
Just get a copy of Atari's last stockholder's report for a real eyeopener!

> [...] - people WANT games, but don't get them - that ANY games
>maker, offering a good (even relatively cheap PC/Amiga-conversion) new game,
>will (!) sell a lot!

And what constitutes "a lot" in your opinion? Enough to be profitable?

>4) It would be much simpler for programmers to make Falcon conversions from
>e.g. PC games, than ST-conversions.

Sorry to burst your bubble, Tommi, but it just doesn't work that way. I'm afraid
there are considerably more complex problems to overcome in converting a game
from an Intel processor to a Motorola one, let alone the operating system. Sure,
it _can_ be done, but is it worthwhile? Most likely not. Full time professional
game programmers such as Dino Dini could elaborate but you get the idea.

Please... do NOT condemn developers for not supporting the Falcon (or any Atari) to the extent YOU think they should. Unless you actually have experience trying to develop and market an Atari software product, you quite simply will have no comprehension of the problems and costs involved, let alone a real-world idea of just how DEAD the market has become. If the market was as ripe as you claim, we would be swamped with new software titles everyday, there would be an Atari dealer in every town, and Atari would be a Fortune 500 company. But as we all are painfully aware, that's simply not the case nor is it likely ever to be.

I don't mean to be full of doom-and-gloom, here; that's not my intent. Atari computers are still wonderful machines and there is absolutely no reason why we can't enjoy them for many years to come. But as long as hardware sales are depressed, the software market will continue to decline, leaving only those who program for the Atari out of love for the platform, not a profit motive.

And what's wrong with that? ;-)

>Neil Jones-Rodway UNIVERSITY OF KENT
>Computer Science Student At Canterbury ####

Sorry about that,
Seriously, the speaker noises are probably due to it being set to full
volume until the control panel loads and sets it right.

It probably doesn't help much, and it may be completely wrong, who knows? :)

Not so secret- I imagine this project to be the 0{+> (That's how you write `Prince' now apparently) interactive CD , which is supposedly out soon- or yesterday, according to where you get your information from. Apparently you get to visit Prince's love suite, etc. No llamas...

: the program illegally.

In my case, then, the trial period expired in 30 seconds!

In this case you certainly did something wrong. How to save
your .set and your .opt file is for the beginner not always obvious
but explained in the online help (just press HELP anywhere in connect
you want). Probably you just aved the options and wondered why
the terminal settings were always reset? Changes, made using the window
menu are saved in the .set file, overall changes valid for the whole
program in the .opt file. Connect certainly gives you more than 30 seconds ;-)

There are two excellent programs for math and english that go by the names of Bentley Bear Math and Bentley Bear Word (not sure about the word and math part of the name...but if you can't find them, post again and I'll look them up)

The word game gives you various levels of difficulty by limiting the length of each word.
As you guess the letters, they either appear in the appropriate place in the word or when wrong a crow moves closer to Bentley's pool-side glass of lemonade. Guess wrong once too many times and the crow drinks his lemonade.

My six-year old loves it!

The math program gives you the choice of multiplication or addition/subtraction and also has some good graphics to make it fun.

Good luck in your search...my E-mail routing hasn't been set-up right yet, so I can only see a reply if you post to the news group.

David's my name... sailing is my bane.

4777. RE: Is ICD dead?

Newsgroup: comp.sys.atari.st
Date: 1994-06-15 22:07:09 UTC
From: dunham@src.honeywell.com
Message-ID: <2tnu2d$12t@moon.src.honeywell.com>
Source record: 185192

No, their just very s-l-o-w!
I am curious if anyone else has had a similar experience:

Last summer, I received a mailer from ICD regarding a "sale" of discontinued items, like the AdSpeed STE 16 MHz accelerator, ao I purchased one. As time went by with no delivery, I realized that ICD did not actually have these in stock, and in fact were waiting for certain components to fullfill the purchase orders. During the two months I waited, ICD kept saying that they will ship in "two weeks". Each time I heard this it was less funny. Finally, I faxed their president, Thomas Harker, and cancelled the order.

Now it gets interesting! This year, 8 months after the order, and 6 months after I cancelled, a AdSpeed STE accelerator shows up mysteriously, and I am billed. What's wrong with this picture, you might ask! :-)
1. I cancelled the order.
2. There was no communication from ICD about the delivery or billing.
3. I almost sold the STE the month before!
4. The unit performs marginal at 8 MHz (No Photochrome possible; then even Spectrum 512 pics had trouble)

Checking with local government revealed that this type of mailorder practise is not only poor business, it's illegal. I shared this with Mr. Harker who told me that 'everyone else is happy that they received their orders' [finally] I responded that an 8 month delay without prior consent is inexcusable. ICD at least offered a full refund if I wished to return the unit. I decided to keep it, but did have to get an exchange because it began to fail to display Spectrum 512 pics. I just received the replacement unit today.

Here's the big yuk: Inside, printed on the invoice, it said:

"Unauthorized Return of AdSpeed STE accelerator"

Ooooooooo! Scary! (Even though I have a fax from Mr. Harker stating that I may return it). So, in answer to the query: "Is ICD dead?" the answer is "No - they are still doing business as usual!" Hmmm, now all I have to do is see if they actually fixed the unit... (to be continued?)

At the helm of the U.S.S. AdSpeed,
Scott

> Bing! wrong. Acorn designed and build the ARM. UK processor designs - yummee!
^^^^^^^^^^^
Well, sort of. ARM used to stand for Acorn RISC Machine while the architecture was developed - don't think many were made then though. A seperate company, ARM Ltd. was then formed, ARM here being Advanced RISC Machines. They have then licensed the technology for other firms to make as they are a design only house - no manufacturing. Acorn still have a holding in ARM though.

Anyway, what's wrong with a UK designed small, low power RISC CPU ? The Archimedes are a damn sight more powerful than your standard ST wouldn't you say ? And as for the RISC PC ... (OK shame about the price)

>Their Finest Hour is a Lucasfilms game, right? If so, I believe that is the
>one a buddy of mine raved about for several months. He thought it was
>great, YMMV. I haven't heard of the other two.

I have "Their Finest Hour" (Yes, it is a Lucasfilm game), and I play
it quite a bit. To nitpick, I'd call it a combat game, not a true
flight-sim. Flying basically consists of cranking the throttle
up to full and just using the joystick from then on.

The game is a lot of fun, but you have to be resigned to getting
shot down more often than not. This is not a turkey shoot; the
enemies are just as tough as you are, and you're always outnumbered.
Even a single kill becomes cause for celebration.

The gripes I have with this game have mainly to do with some of the
artificial intelligence decisions. I usually play the British, and
I've had Messerschmitts chase my wounded Spitfire far into the north
of Britain, even though fuel considerations should make this
impossible. Any wingmen you start a scenario with are usually
inept enough to get shot down immediately, leaving you in a one-on-
six situation or worse.

On the plus side, the graphics are pretty cool, and the gameplay
is intense. If you're not a flight sim purist and just want combat,
then this is a good choice.

|> outlay for an extra market, but still companies decide not to bother because
|> they could make more money else where. That's business, but it is killing
|> a potential market before it has opened up....

Just a few additions to this, I've had the opportunity to speak
with an amiga programmer from this company: despite the fact the Pc Boxes
are sold at a much larger scale, the ATARI FALCON sales+COMMODORE 1200
sales=1.1 PC sales for Ishar. To emphasize the point, PC are everywhere but
offices don't buy games :-) and the illegal swapping is far worst there than on
any previous computer. They just don't understand why they should avoid
27% of their total sales and abandon Falcon..

About the cost of a conversion PC -> FALCON, don't try to explain me
it would require several month-man to do. Graphics are the same, Music is the
same, the code itself is 99% in portable C (you just have to recompile the
whole project on the destination machine), the only difference would be in
activating the same graphic mode or playing this common sound but all the
machine-dependent stuff can be encapsulated by meta-commandes which would only
imply to develop the machine-specific library once !!!! And use it again and
again with no extra cost !

That's all !

> AHDI seems to spend ages trying to talk to the IDE which isn't there.
> Is this normal? I have tried turning off the IDE checking with

This is normal... The Falcon first tries to load AHDI from IDE. Then
AHDI searches for drives in sequencial order starting from the IDE and
stops to the first SCSI device which isn't connected.

> Is there anything I can do to speed things up?

Yes... Get XHDI. It comes with a config program so you can turn the IDE
searching off.

My speakers, internal AND external, pop quite loudly when FPATCH2 runs...

>3. Why does the fan occasionally slow right down and start making a horrid
> grinding noise???

We've found SEVERAL Falcons have arrived from Atari with the fan-mounting
screws loose, which caused unusual noises. You may want to tighten them
down and see if this is the source of your problem.

I used to have this same problem until I booted my Falcon clean, with only
the HD-driver loaded. (Read: Press Control while booting!!)
Of course this won't kill the f**king speaker, but since I got rid of it
when I got my computer my pain isn't to unbearable.
I seem to remember curing the Galactic View in the same way!!
I did have my game stored on Drive F too, and it worked without problems
for me!!

Darek specified in the ST XFORMER V2.55 source README.DOC file that
the source would only be available on GEnie and CompuServe, so that's
probably why it isn't FTP'able or otherwise widely available.

Anyway, I have the source LZH'ed and uuencoded. Those who were
looking for it, Email me and I'll Email the archive to you. It's
about 138K uuencoded.

CEO file contents:
Hi,

Is this game _hard_ or what ? The Intro is great, sounds are great, the 3D graphics are great, but I just can't make it through the third screen.

How the hell do you get past this black red-eyed feline monster thing that jumps straight at you ??? It sure was a shock the first time but after two hours, it's getting a little bit boring...

Is all the game like this, or am I plain stupid ?

Bye,
Nick.

I am posting this (update) for a friend. I do not know anything about
this program. So please do not reply to my adress.

Norbert

Mydraw is a powerful vector drawing program for the Atari ST and TT,
b/w and color.

Version 1.10' , date 12.11.93 . Shareware, no restrictions.

Features:
- supports SpeedoGDOS, Speedo Fonts can be rotated freely.
- Textfile-Import. Textformatting with justification.
- Businessgrafic module with Data-Import: Line plot, pie chart, map from
"The world digizized" data.
- Smoothing and editing of polylines.

As far as I can remember, you have to run left, jump to the rope, swing a
little bit. Then try to run back to the right. If you can run fast enough,
...

Perhaps this can help you. But don't give up, it's a great game and you'll
have to go a long, long way before you can come to the end.

Bye,
Erwin

From: bensmith@teleport.com
Message-ID: <2tpbrv$1p8@elaine.teleport.com>
Source record: 185114

I'm looking for the ST's ICD Host Adapter Software. The version just before the LYNX version. I don't have the LYNX and I don't want that version. I ordered from ICD and received squat. Best Electronics told me they won't carry ICD til they clean up their act. They told me people ordering from ICD are waiting, some for months. I also set my MoDeM to AutoDial ICD BBS and haven't got through for days. Can someone !?!HELP!?! Can someone send me the software?

Please Reply in E-Mail

Ben

It's "what". The first level of the game is one of the hardest. And I was
a bit shocked by the ending: I expected there to be about 50 more levels!

Now, Flashback, that's a much better game. Anyone know if there are any
more Delphine games in the same vein in the pipeline?

Under Windoze, a shareware program called Paint Shop will load IMG and
save PCX (along with several other common formats for load/save).
Presumbably Paint Shop Pro would be able to do it, too.

Check your favourite Windoze FTP sites for ps*.zip in a graphics
directory; that should be Paint Shop.

|> I just started using mint-net, and am having afew problems.
|> rlogin mentions that is requires mintnet .43, but I can only find

Can't believe that. Mine works fine with 0.4 PL2.

|> version .42. Does .43 include the Pseteuid and Fselect patches? If
|> not, how do I get the Pseteuid patch?

The Pseteuid patch was published on the mint mailing list some weeks
ago. The Fselect for exceptional conditions would probably need greater
changes in the kernel, and will therefore probably take a bit time...

|> Does rsh work with a bsd host,
|> and if not, how can I log on to my 386 from my st?

It _should_ work with rlogin and your Linux (?) box. Which versions
of rlogin/rlogind are you using?

|> Also, I can't ping the st. ftp, finger and rlogin cause a
|> crash (presumeably when they try to call p_seteuid), but ping gets no

None of these calls Pseteuid. Only the ftpd needs it, but even this
shouldn't result in a crash if you haven't got it.

|> responce at all. Has anyone encountered this problem?

The ICMP message required for ping is not yet implemented.

>
>According to Bob Gleadow a few months ago, there were 80,000 Falcons in Europe
>(according to an ST Review interview)... [...]

This unsubstantiated comment is _exactly_ the kind of 'rose-colored hogwash'
I posted about yesterday. 80,000 Falcons in Europe??? Good grief, people, get
a grip! That is far, FAR higher than the total number of Falcons _manufactured_
to date. The actual number of INSTALLED Falcons worldwide is much, much lower
than what anyone has estimated here so far. Now figure 3-6% of whatever the
installed base is will purchase a decent software title if it is marketed well
(how you do that for the Atari is a tough one). Now figure 10-20% of the retail
price of the product is returned to the publisher as profit after expenses.
There just isn't much left over, folks.

>Now, Simarils have established a method of converting PC games to the Falcon -
>it now takes them only about one month - so that is not much of an initial
>outlay for an extra market, but still companies decide not to bother [...]

Oh, I think you would find it to be considerably more expensive than you think
to convert PC games to the Falcon. Don't forget marketing and support costs?
Their decision about not supporting the Falcon is not about making MORE money
elsewhere, it's about not LOSING money on Atari versions!

>Come on, give the market a chance. Even Microprose were suprised with the
>amount of copies of Formula One Grand Prix they sold to ST owners....
>And before you say 'Oh piracy is a big problem on the Atari platforms', it is
>a problem, but nowhere near as big a problem as it is on the PC platform, [...]

And what do you base this on? Sure, there are a LOT more pirated PC programs
because there are a LOT more PC's out there (an understatement if there ever was
one!). But it's the PERCENTAGE you have to watch out for. In a small market like
Atari's, every pirated program costs the developer/publisher/retailer a lot MORE
than one stolen program out of the huge PC market. Piracy is not the reason the
Atari market is so poor, but it DOES bear more importance than in the PC world.

Dunno, I think it's the original version, but you can get the volume
control option by holding down ALT whilst double-clicking it.

>Oh, and I finally got a chance to look at it on an ST monitor.... what a
>pointless demo.

I suppose it depends on what you mean by a pointless demo. :) I quite liked
it myself, apart from the bug in the 3D world bit.

Michael.

Hi Gerhard! Well, I think it's a nice demo anyway. :)

I expect you've already heard about this bug, but there's always a tendancy for the demo to crash in the two 3D-world sections. (Well, I assume there's two, since I haven't got past the second one yet!) This bug crops up on my friends Falcon as well. (Which is a different TOS version.)

C/C++, you're probably looking at GCC/G++, available at aaue, as far
as I know, G++ is the only C++ implementation available for Atari.

Prolog, I am using a Prolog68 interpreter, it is almost a full
implementation. Just run archie -s prolog68, it should give you a list
of hosts.

When the monster appears run left as fast as you can. The monster will catch you but stumble at the last moment and give you more time to escape. When you get to the left-most screen (one to the left of the pool where you come in) jump and you will catch the vine in the background. Wait until you swing back to the right and jump off. Run like hell to the right where, after about 4 screens, you will receive some assistance in getting rid of the monster.

4819. UK: hard drive recommendations?

Newsgroup: comp.sys.atari.st
Date: 1994-06-16 16:22:08 UTC
From: kevinb@central.susx.ac.uk
Message-ID: <2tpu7g$hjm@infa.central.susx.ac.uk>
Source record: 185132

My current hard disk drive (a Power model with a fast but noisy Quantam drive) is having increasing difficulties starting up and it looks as though I'll have to replace it. I use an ST Mega 1 (4Mb).

My main requirement is that the drive should be very quiet but speed is also quite an important point. Of the drives advertised in ST Review, the following interested me:-

Systems Solutions MiniHS 170 Mb Price: 319 + ICD Link @ 20 = 339
or maybe even 270 Mb Price: 399 + ICD Link @ 20 = 419
Comments: *plastic* case! "Quiet fan"

Ladbroke Computing
Data Pulse+ 170 Mb Price: 270 + ICD Link @ 80 = 350
or maybe even 270 Mb Price: 360 + ICD Link @ 80 = 440
Comments: "Very quiet, no fan necessary"

I should be very grateful for comments on either of these makes, or for recommendations of any other drives you think I should consider. I'll summarise any email replies I receive.

Many thanks in advance,

Kevin

Well I recently purchased an AdScsi micro from ICD. I mailed the order off and the adapter was with me in about a week. I then had trouble getting the adapter to work, phoned their support line at the allotted time and spoke to Howard who gave me a return code to return the adapter. About 4 days later Dan phoned me to say he could find nothing wrong with the adapter and we talked through my setup and some more tests I could do at my end. As it turned out the problem was my Quantum 105S was not supplying TERMPWR as the fuse had never been installed, this was very unusual. The adapter arrived back today and on the whole I am very happy with their service.

[...]

Well, the ST version of GOAL! had problems, because GOAL! is much more advanced
than Kick-Off 1 and 2. I coded the original KO on ST first, then ported it
over to Amiga. This is of course 5 years ago now.... at that time the ST market
was good. But when it came to do it the other way around, I had problems, because
I was moving to a less powerful machine (Amiga -> ST). I shall qualilfy that...
less powerful for coding my football games.

After it was finished, there were some new problems which took a few weeks to sort
out (hence the updated release). This put me behind on my other projects.

I let you draw your own conclusions from there.

Message-ID: <friedric-160694134642@appletalk-72.mdd.comm.mot.com>
Source record: 185141

To any of you out there using Cubase Audio for the Atari Falcon--

What are you using to input audio into your Falcon? Are you using microphones directly plugged into the Falcon's sound inputs, or are you using Steinberg's special unit that allows direct connection to the DSP? or what? How are you converting analog sounds to digital (if you are) ?

I've got a Falcon, and am considering upgradio to Cubase Audio. I've got a small home recording studio, including an Alesis ADAT, but no DAT machine that has A/D converters.

What are my options in getting sound into the Falcon to be recorded by Cubaase Audio?

Thanks in advance,
Bernd

Don't take this too personally - but I think that if people don't have anything
but bad news to tell about their computers - and like to keep on telling, how
miserable a firm Atari Corp. is, etc... Isn't it time then to change a machine
- or at least the subject? We could talk about nicer things too, you know ;-)

Like:
New programs, HOW to get new programs (instead of explaining why there won't be any..), happy things. What do you think..? Or this area must be renamed: comp.sys.atari.complaining ;-) ?

That's exactly why I wonder that you're not interested in moving to a much more
powerful Atari than Amiga is... It's strange: when game makers stop supporting
ST - they stop supporting Atari. They don't even think about ST's possible big
sisters, like Falcon. After ST: nothing?

I may be dumb - but could you tell me, why people started making 386-only
games, when there only were a handful of terribly expensive 386:s in market. It
was natural that when PC-technology goes forward, the games will follow?
With Amiga situation seems to be the same - as with Macintosh. New machines
very seldom bring immediately money (speaking of games), I believe? But those
new games help to make the new hardware more popular - so after a while, the
whole system works.

Why it is that you don't believe in "life after ST"..? Do you think that old
ST-users stop computing, or move to other computer platforms?
That's THE question. You said that ST games "sold well years ago". Why do you
think that Atari computer games would never again sell well - or be popular?
It's not so much up to us - but up to you, who make software.

I'd respect a software house that'd make at least ONE Falcon game (a good one,
preferably) - to see what happens. Instead of saying: "No, it won't work - we
won't even try..". The risk really cannot be that big - in most cases, at
least. By doing that you just MIGHT give that new machine the push needed to
make it popular - and after that... More money for you, too.

I hope to believe that you can agree with me on that. We can't force anyone to
do anything - nor we want to. But simply: it would be great, if e.g. you could
give Falcon a try. If it failed... Then you'd know. If it succeeded... Well,
time would tell what then. But if you're honest to yourself: was it really so
certain that Amiga 1200 will succeed? Atari has a very strong music market
behind Falcon-030 - and musicians want to play, too.. (I should know that -

thinking about all my friends with Falcons, synthesizers, and - their curses about the lack of games..!).

Falcon isn't a "big" ST. It's a very different - very much more powerful computer. It might be much easier for you to program than ST - or even Amiga. Built-in hard disk, 1.44 MB disk drive, 16 MHz Blitter, support for Atari Jaguar's new joypads and analogical joysticks, a palette of 262.000 colours, etc - they should make life a bit easier, if a programmer wants to make something a 520 ST isn't capable of.

Finally: if you don't want to consider giving Falcon-game a try, then I don't want to test your nerves much longer.. =-) But now you know something about the ST's follower - and may make your own decisions, if you want to.
Hope you'll do.

Best wishes, Tommi.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after

uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Leave the caches on for faster screen update but remember to hit the retry
button almost immeadiatly upon a disk failure msg. Once the disk is spinning it
reads the data fine (it only fails if the disk has stopped spinning!)

I have seen info on here regarding getting ICD Software on Internet..

I don't think this will work, many people in the past have asked this,
ICD are adamant that it is only on there BBS and GEnie..

Mind you I here that there BBS is down all the time...??

But there support of GEnie has a lot to be asked, this is a part copy
of there GEnie bulletin as of to-day...

RF> finish its manual.

Well I guess you wish to support your own Geneva system but could you say
whether Neodesk 4 will be compatible with MAg!X (I assume it will be)
but of more interest will it support it's specifically.

I liked the look of the 'feature' list preview I read in STA and am looking at
it as a possible alternative to Ease if it will.

D> for instance. Even a single program that would give me a nice front
D> end to make selection quicker and easier.

There are (DC_EXTRACT for example) but why don't you just install them all
(ideally as TTP) so that all you don't have to bother selecting the archiver
specifically.

It was none other than Andrew Bianchi that wrote on 13 Jun 94 that ,
AB> While I have to admit that Mag!X is probably faster than MultiTos,
AB> and this is
AB> still probably true for AES 4.10 I am curious as to what MiNT/AES
AB> system calls
AB> it supports.

Is is largely compatible with AES 4.01 but not with MiNT functions. I would
expect Mag!X to continue to maintain this position. Although implimentation of
MiNT function's is not ruled out (from the MAg!X programmers guide).

AB> MultiTos has it's problems (as does Mag!X or any piece of software
AB> for that matter) but Atari has decided that it will take this as it's
AB> standard multitasking OS which provides certain features to the
AB> programmer. If the other competing multitasking systems do not
AB> provide these features then they could end up being incompatible with
AB> some programs.

As long as it takes _years_ to get updates out then I fear MultiTOS is the
operating system which will be left behind (regrettably ,I stress !)

I concede the point about MiNT and it's place amongst programmer's but MultiTOS
is supposed to be the user OS based around it and to be rather harsh about it
Mag!X is more useable that Single TOS whilst MultiTOS is
NOT.... IMO :-) This relationship is maintained ,albiet to a lesser extent
with AES 4.10.

friedric@mdd.comm.mot.com (Bernd Friedrich) writes:

>To any of you out there using Cubase Audio for the Atari Falcon--

>What are you using to input audio into your Falcon? Are you using
>microphones directly plugged into the Falcon's sound inputs, or are you
>using Steinberg's special unit that allows direct connection to the DSP? or
>what? How are you converting analog sounds to digital (if you are) ?

>I've got a Falcon, and am considering upgradio to Cubase Audio. I've got a
>small home recording studio, including an Alesis ADAT, but no DAT machine
>that has A/D converters.

>What are my options in getting sound into the Falcon to be recorded by
>Cubaase?

much to my disappointment, i've got a books on tape adapter (splitting the signal into r and l 8th inch jacks), a stereo to mono adapter in each plug of that, then an attenuator (sp?) plug in each of those--all to get the stereo output of my mixer into the falcon. so my audio is going through three adapters before it even gets to the computer. all of this can be solved by opening the falcon up and changing things that shouldn't have to be changed ion the first place (imo), or getting a cable that has resistors built in (any idea where i can order one?). also there's an mixer thingy that i've seen in the english mags (once again, anyone know where to get one stateside? anything to bypass my radio shack solution). what do you mean about converting analog sounds to digital? isn't that what the computer is doing? there's no such thing as an analog sound once it's inside, it's now digital information. the falcon then converts it back to analog for playback and shoots it out the bass boosted output (another bummer, which can be bypassed with internal mod or the output adapter that steinberg is coming out with that has eight seperate 1/4 inch outs--hopefully stereo for the 16 track upgrade) or keeps it digital if you've got the output adapter (steinberg's is called F.D.I.). all of this external gear sounds neat but my man at toad informs me that falcons have a habit of blowing up "literally catching on fire" when they have too much audio stuff connected. anyone heard this? ...unfortunately none of this matters for me right now, as i get clicking through all of the audio tracks i record. steinberg tells me that some of the falcons "just do that" with cubase audio and i'll be waiting until the end of the summer for them to issue the update. sorry to go on.

> is this the Wing thing that I have been reading about...

There is a SIMM upgrade for the Falcon, called the RAM Gizmo, available from chro_MAGIC Software Innovations, that is currently the ONLY SIMM upgrade board that I am aware of that will work with ANY brand of SIMMs. Last I had heard, the FalconWing was having trouble with using any but certain brands of SIMMs. You might want to double check this. Anyway, the Falcon board that is available from chro_MAGIC should be available from your nearest dealer. If you prefer to go mail-order, you can get it from Best Electronics, Pacific Software, The Computer Network, or Systems for Tomorrow. I don't have numbers for the
first three, but Systems for Tomorrow can be contacted at: +1-800-875-4943. If you prefer to buy the board direct, you can reach chro_MAGIC Software Innovations at +1-417-623-7393, or you can send mail to me at

gizmo@dswhq.omahug.org

or to chro_MAGIC Software at

bambam.dswhq.omahug.org

Later,
gizmo@dswhq.omahug.org

Rowland Baker <sccoe@ucscb.UCSC.EDU> wrote:
>
>I remember mention of some sort of funky 8-meg upgrade for the FALCON a
>while back. Does anyone have any clues so I can track down this beast?

Atari still maintains that 8MB on a Falcon030 is not
possible. However, the fact that you CAN have 8MB of
32 bit wide RAM (you can buy 8MB 72-pin SIMMs and one
of the Falcon SIMM upgrade boards that allow the use
of single 72-pin SIMMs) has me almost convinced that
it HAS to be possible SOMEHOW (via a SIMMFIX-type
program like the STE had to allow 2.5MB). If I had
the money right now, I'd try it out.

>there that sort of work..??

I use EasyRider, a very good 68030/68881 Disassembler with GEM-Support.
EasyRider is mainly a Re-Assembler - you can diassemble all kinds of
programs, ROM, Cardriges and Bootsectors. EasyRiders allows to import
the symbol table of the programm, or you can assign your own labels.
Even tricky stuff like using an adress register as global pointer to
all bss data (megamax c did that) are handled by EasyRider.
The user interface and manuals (of the version i have) are in german.
EasyRider costs about 250 DM (i think), the autor is Andreas Borchert.

An older Disassembler i know of is Detective, you could not change the
labels. I dont think that Detective is still sold (it was from an
UK company).

You can also disasselbe with TempleMon or PeaceBug, but you dont
get label information - but global symbols are supported with
the SYMBOL driver from Robert Federle. TempleMon (2.02) and
PeaceBug (1.21) are ShareWare, you should find them on some
FTP servers.

Greetings, Karsten

|> (Yes I know, I should kill this beast.)
Just plug if off, there is a small plug inside. You don't have to cut anything.

|> My problems are:
|> 1. E II doesn not know of Drive F, where it is installed (because D and E are
|> Minix Partitions?).

|> 2. E II looses Systems. After some mission I go back to map F2 and there are
|> substantially less star systems. Somtimes I lose the system where I am.
|> When I try to get a mission for a lost system from bulletin board, there
|> is only the button "Hang Up".
|> 3. Also the Galactic View (F10 in Galactic Map) is always corrupted.
Points 2. and 3. are connected. Elite II seems to have a (quite low) number
of "real" systems which are stored on disk. But most of the systems are created
by a pseudorandom algorithm. This algorithm seems to get its input (density of
star systems in a sector) from the galactic chart. So: Wenn your galactic chart
is corrupted (at least if the part where you are is corrupted) you won't get
the correct local chart. Clear?

Help: I boot EliteII from a HD-disk. That works sufficiently fast (IMHO) and
has got no problems. (Remember: HD has twice the speed of DD...)

ciao Michael

> or maybe even 270 Mb Price: 360 + ICD Link @ 80 = 440
> Comments: "Very quiet, no fan necessary"
Are you sure you need to replace the whole box, power supply, host
adaptor, etc? If you just need to replace the drive, then bare SCSI drives
are *much* cheaper than the prices quoted above (Hint: Look in PCW for
the big mail order places, not in STR). I recently paid less than 250 quid
for a 270MB Quantum.

Furthermore, are you sure it's the actual drive that's noisy? It may
be the fan, in which case you could try finding a quieter fan to replace it.
Or just do away with the fan altogether, they are often superfluous in
such equipment. My old ST drive box never had a fan. My new tower case
does have one, but that's necessary because it's got a BIG power supply,
for powering several drives and other bits. It is a fairly quiet fan,
though; I get less noise from the tower than from the Falcon.

Perhaps there exists some kind of thermostatic fan, that only turns on when
the box gets too hot?

>Has anyone else spotted this?

I mailed HiSoft about this problem, and got the response...

Winx causes the bug, doesn't recognise Shift-Ctrl-S, use without it.

I also enquired about a C++ compiler, if they had any plans to make one, and the owner said they are hoping to have something to overlay Lattice C later this year, but no promises yet.

Hi!

The new GEMINI-Distribution contains the MUPFEL shell, which is now a ttp program. Is it possible to work with MUPFEL alone (under T0S 1.04) as an autostart application, allowing to call GEM-programs from it? I tried the Microshell from the Okami distribution, but it didn't work.

Another question: I'd like to type c:/dir/file, instead of c:\dir\file. I was told that the old MUPFEL could handle this by setting a certain variable (SLASHCONV=true). Can anyone help me?

Ruediger Franz

You should try things like TwoInOne. It's a fantastic shell for all standard archivers
(.LZH, .ARC, .ZIP,...).

I work with it and had no problems with it (and the newest archivers) until now.
The newest versions I Think are:

Lharc 3.10
ARC 6.04
STZIP 2.6
ZOO 2.1.4

All these packers and some Utilities are included in the TwoInOne-Package.

Hope that helps.

Christian.

>president, Thomas Harker, and cancelled the order.

Well I recieved a ADspeed from a Friend that ordered 2 plus a few Micro host adapters...

I then fitted the ADspeed and the ICD Micro host and Auto Overscan, the after a few hours things started to fail, the MEGA ST was SH and I had only had it a few weeks...

I removed all the add ons, I still had problems,this was traced to a faulty RAM chip, this was replaced, the ADspeed refitted, but then it would still only run for 5 mins...

Decided to send this Back to ICD, my friend faxed them a recieved a RMA number, I then sent the ADspeed back by Air Mail...

After 6 weeks, I decided to send them a E-Mail, no responce to that and 2 more E-Mails and my friend sent them a Fax, not responce..

But in 4 days after sending the Fax this replacement unit arrived, a total of 8 weeks....

>4. The unit performs marginal at 8 MHz (No Photochrome possible; then even
> Spectrum 512 pics had trouble)

There are no problems with Spectrum or Photochrome at 8 MHZ, Please run the 8 mhz program first, mind you this is not on a STE..

Please don't use the TSR Auto folder program, its full of Bugs, use the CPX instead...

>As I said in an earlier article, it will crash on 4Mb machines and won't
>boot under TOS 2.06 (on an STE, at least), but these are minor niggles (with
>simple solutions) and can't spoil a great game.

'...it will crash on 4Mb machines'. Well, that stuffs me up doesn't it? WHY
do some games not work on machines with memory cards? If there is some
specific reason, why don't the programmers 'hide' the extra memory - I beleive
their is a PD program to do this.

Surley the programmer will have at least 4Mb in his development machine anyway
so testing for this problem should not be too hard.

The other problem...TOS 2.06. Where do the problems arise? If the 'bug'
or incompatability is known, why not check the version of the OS on loading
and if it is 2.06, call the fix?

I know that this oversimplifies things slightly but...

It's a shame really because I prefer the Kick-off range to Sensible. I was
going to buy Goal but the two reviews I've seen so far gave it 48% and 60-odd%,
not high enough for me to part with twenty-odd pounds for a game.

>Their decision about not supporting the Falcon is not about making MORE money
>elsewhere, it's about not LOSING money on Atari versions!

There need not be any marketing costs - the ST press will do all that for you,
just a few phone calls to Europress, Future Publishing and so on, and you'll
get big mentions in the news, and possibly large reviews as well. The games
market on the Falcon is so small, marketing on a large scale is really a waste
of money....

>>Come on, give the market a chance. Even Microprose were suprised with the
>>amount of copies of Formula One Grand Prix they sold to ST owners....
>>And before you say 'Oh piracy is a big problem on the Atari platforms', it is
>>a problem, but nowhere near as big a problem as it is on the PC platform, [...]
>
>And what do you base this on? Sure, there are a LOT more pirated PC programs

>Atari's, every pirated program costs the developer/publisher/retailer a lot MORE
>than one stolen program out of the huge PC market. Piracy is not the reason the
>Atari market is so poor, but it DOES bear more importance than in the PC world.

Piracy is ripe amongst EVERY PC owned by games-players.... the VAST majority of
original software is sold to businesses, where they cannot afford to be caught.
As far as home PC's go, they aren't even going to have anybody checking wether
they have pirated software or not... I know LOTS of people here at Uni who have
PC's, and NONE of them have more than two original copies of ANY of their
software - it is all copied...

No point to it really - why spend hundreds on a top-of-the range computer and
then never know how to use the software properly????

I, along with a lot of Atarians, have very little prated software... In fact, I
have only one peice of pirated software on my HD - a paint package - which is
going as soon as my copy of ChromaStudio 24 arrives (which I have already paid
for). The PC market is a pirate's paradise.

Hello, there, I need them for my MacMiNT, but as a novice, I don't know
whether these have been included with some exiting shell installing files.
I just can find 'em at atari.archive.umich.edu.

Thanks a lot!

Chuck

You can run Mupfel alone, just as any ttp program, and of course you can
autostart it under tos>1.4, but you _can't_ run GEM programs from it. That's
not a shortcoming of Mupfel, but a consequence of its being a ttp program.

>Another question: I'd like to type c:/dir/file, instead of c:\dir\file. I was

>(SLASHCONV=true). Can anyone help me?

I don't know. If you find out, could you please let me know...? I've been
searching for this possibility too, but haven't been able to figure it out (if
it is possible at all, that is...).

Hi, Bales_N! On 13 Jun 94 you wrote:

BN> From: Bales_N@CIRAD.fr
BN>
BN> I was thinking about getting myself a Falcon. Is there a FAQ
BN> somewhere about this machine ?

I don't think so.

BN> I'd like to know the general specs, the graphical modes, what sort
BN> of connections you have ? Does it use SIMMs for memory expansion ?

CPU: Motorola 68030 16MHz
DSP: Motorola 56001 32MHz
FPU: Optional Motorola 68881/68882 16MHz
RAM: 4MB (max 14MB)
HD: Internal Conner 2.5" IDE
FD: 3.5" High Density 1.44MB (MS/PC-DOS compatible)
OS: TOS/GEM in ROM, MultiTOS multitasking OS
Audio: 8 channels 16-bit 50kHz with Direct-to-Disk Recording
Video: Up to 768x480 (1280x960 with external videoclock)
2-256 colors and 16-bit True Color mode (65536 colors)
I/O: SCSI-2, Centronics, RS232, Mouse, Joystick (2+2), Stereo in/out
Monitor (RGB+VGA), TV (RF), MIDI, DSP, LAN, Cartridge

Note: These are the basic factory default specs, There are 3rd party expansions
available that will improve on most of these specs.

BN> I've read that you can badly crash the machine when you fiddle with
BN> the NVRAM and that you need a special program to boot it up again.

Not exactly crash the machine, but you could end up stuck in the wrong
videomode, The best way to avoid this is of course not to fiddle with the
settings until you know what you're doing. It has kept me safe anyway.

BN> What about 2.8" disk drives ? What are they worth ?

Huh? There's room for a 2.5" hard drive inside the Falcon, and the 3.5" floppy
drive is on the right side. That's all there is.

BN> I've also read that you can connect an SC1224. Well, I'd like to do
BN> this as I haven't the $$$ to get a VGA yet, but where do you plug it
BN> in ? The SC1224 has a special ST plug (DIN-like, but with 14 pins)
BN> that the Falcon doesn't seem to have. Where can you get an adaptor ?

You must have an Atari RGB-adapter connected between your SC1224 and the
Falcon's videoport. It's available from your dealer.

BN> Or should I rather plug it in the TV ?

You could, but the result is poor compared to RGB. But if your TV has SCART input, you could use it as a substitute for a RGB monitor. I do.

BN> There was also a text file with the compatibility status of most ST
BN> games. Does anyone know where it is ?

It's posted here once in a while. Look for it.

BN> Last but not least (putting on the asbestos suit...), is the Falcon
BN> a really good choice as a serious general-purpose computer ?

I wish it were so, but the PC is probably a much better general purpose computer. The Falcon's main strengths is in music and graphics. It is also the logical next step if you want to upgrade your old ST/STE and still wish to use most of your old Atari software.

Hello Nathan if this finds you at GENIE, thank you for your reply courtesy of someone on the Internet. Regarding my version of DA VEKTOR, i have version 1.10 (the latest version as far as i know), and i can export colour CVG's ok, except when using the tiff fills. I have to save the file as a .TIF and then convert it to a GIF via GEMVIEW!!!!!! bummer!!!!! I havnt tried it yet, but i think that if i then load the file into calamus (the now converted GIF) and then use the BRIDGE.CXM and then use the EPS>CVG converter, then finally i will have a full colour "filled" CVG. I have been advised that DA wont allow full conversion of some files to CVG because of "politics" and that the only sure way is to buy DIDOT!!!!! (no thanks I've already got the best hehehehe). Unfortunately the manual that comes with DAVEKTOR does not mention anything about conversion problems, and i am under the impression that this problem should be happening. Still it is a great program, despite having to go the long way around to get what I want. Thanks for your help. If anyone on the Net can feed this thru to Nathan at GENIE i would be most thankful. Bye 8-)

They were probably referring to the Comeau C++ compiler (or
preprocessor, apologies to Warwick :-) which has been available RSN
for about a year. And no, Atari Corp have not been involved in the
project :-)

I concede it is MUCH less costly to market s/w for the Atari than other makes (after all, there are a lot fewer potential buyers) but if you honestly think you can successfully market a commercial software product using only free press, then you really _are_ inexperienced.

>I, along with a lot of Atarians, have very little prated software... In fact, I

Oh, I'm sure it would be very comforting news to the author of your 'one peice <sic> of pirated software' that his work holds that position of honor on your hard drive. So by your own admission, you are just a small criminal, not a big-time one? C'mon people! When are you going to accept piracy (of one or 1,000 titles) as a crime? It amazes me how some can be so callous about theft.

No, piracy is not the chief cause of Atari's woes. But it IS a contributor!

I do not have access to German newsgroups, so perhaps someone can post this
message on the German Atari group? Thanks!

A German Language version of Triple Yahoo 1.0 has been uploaded to the
following ftp sites:

ftp.uni-kl.de.............(131.246.9.95)
ftp.germany.eu.net........(192.76.144.75)
ftp.uni-stuttgart.de......(129.69.8.13)
ftp.informatik.tu-muenchen.de......(131.159.0.198)
athene.uni-paderborn.de...(131.234.2.32)

Triple Yahoo is a one to four player Yahtzee game that works on ALL Atari
computers. It runs under GEM and supports DMA digitized sounds, Speedo
GDOS fonts, and color icons. It runs under MultiTOS, Geneva, and Magix2.
Complete German documentation is included with the game.

This game is Shareware, so please make a donation to the author. German
marks are accepted if paid in cash.

4880. LZHShell bug...

Newsgroup: comp.sys.atari.st
Date: 1994-06-17 15:20:20 UTC
From: jpb3@ukc.ac.uk
Message-ID: <8535@merlin.ukc.ac.uk>
Source record: 185225

Some of you may remember about a week ago I posted an article suggesting that the latest version of LZHShell was bugged. I had reported that if Neodesk was used, when you left the shell, you would not return.

Well, kinda on advice from some of the requests, I looked at what acc's and TSR's I was using, and tried to get the shell to work properly. When I removed Turbo ST from memory the shell starting functioning perfectly. Therefore if any of you have this problem, as at least one person did, don't use Turbo ST if you want to do some archiving. I guess other screen accelerators may not go well with LZHshell too.

Thought I'd let you all know.

>
>Do you own an Atari - or not..? This kind of speech is far too common here; in
>a place that is supposed to be an Atari _support_ area..!

Yes, my dear Tommi, I _do_ have an Atari, 3 of them, in fact, including a Falcon.

>Why on Earth do so many of us want to shoot down all a little more optimistic
>opinions ?

A little guarded optimism is fine. Wildly inflated rumors & misconceptions aren't!

>Atari funeral..?

Your choice of words, mate, not mine. ;-)

>So we have a loser computer in our hands?

Again, _your_ words, not mine. However, if you would read all of my posts you would know that I still think Ataris are fine machines and very capable in their own right. They are NOT the bargain they once were and new software and dealer support are becoming scarce commodities, but that's hardly big news, is it?

>Don't take this too personally - but I think that if people don't have anything
>but bad news to tell about their computers - and like to keep on telling, how
>miserable a firm Atari Corp. is, etc...

What 'bad' things did I say about Atari computers?

When did I ever say Atari Corp is a 'miserable' company?

All I did was try to correct a _grossly_ inflated estimate on Atari Falcon sales and come to the defense of developers who YOU were accusing of not supporting the Falcon out of ignorance.

You obviously don't know me so let me introduce myself. I've been an Atari user and owner for 11 years, I've been President and member of several Atari user groups in both the US and Australia, I've written dozens of articles and programs for US magazines such as Antic, Analog, Current Notes, STart, ST Informer, et al, I've published two programming books, I'm a member of the IAAD, I've written and marketed my own commercial Atari software in 4 languages and like most developers, I have no tolerance for pirates or ignorance. Like it

or not, sir, I DO have some basis of experience on things Atari. ;-)

>Isn't it time then to change a machine - or at least the subject? We could
>talk about nicer things too, you know ;-)

As most active participants here already know, I have and enjoy an av Mac in addition to my Ataris. I did finally sell that hog of a 486-66DX2, however. :)

> Or this area must be renamed: comp.sys.atari.complaining ;-) ?

No, that's what the advocacy groups are for. :)

MPEGS (and others) are popular in the IBM world, so you might try
looking around IBM FTP sites. One might be wuarchive.wustl.edu somewhere
in the systems/ibmpc hierarchy...

Anyone make an AVI viewer yet for the Atari?

A friend with an Atari 1 meg 1040ST and Color monitor and
no hard drive needs a very basic database. I saw some
at umich, but I am not sure which one would suit him
best. Also, he doesn't have any archiving utilities.. and
of course ZOO and LZH and ARC are all archived by their
own programs...How do I get the above mentioned archivers
unarchived?

thanks
rick

4887. Q: Best Fortran Compiler for 1Mb atari st

Newsgroup: comp.sys.atari.st
Date: 1994-06-17 18:27:29 UTC
From: georg@doey.nero.uni-bonn.de
Message-ID: <GEORG.94Jun17182729@doey.nero.uni-bonn.de>
Source record: 185090

I'm searching a small fortran 77 compiler for an
computer unexperienced physics student.

I will help him with the installation, but I don't
know too much about the atari (MDOS & Linux are
my fields :-)
So it would bee nice to get a cute paket consisting
of an editor, compiler (linker) and maybe a debugger
if it would fit into this 1Mb machine.

Well, which compiler should I look for ?
What ftp servers should I connect ?

thanks in advance

Georg Bi"seling

Using a Supra, huh? :)

ALT is what Supra calls the "MNP" series of connection protocols. So
MNP4 would be PROTOCOL: ALT, COMPRESSION: NONE, whereas MNP5 would be
PROTOCOL: ALT, COMPRESSION: ALT .

LAP-M is better though, so if you have turned off LAP-M reliability,
make sure you turn it back on (look through your manual).

> Is there such a product? Is it even possible?!

Not directly but with a little harwdware extras it can be done. You'll
need :-

ftp.tu-clausthal.de:/pub/Atari/Telecom/tcpip/tuw-tcp.*

This archive shows the schematic for a cartridge-port to pocket ethernet
adapter (as used on the PC's). The software and drivers are there for
the REIBL (German Ethernet card) and the D-Link DE-600 pocket ethernet
card.

I can't vouch for the compatibility with the TT but I don't think it
should be a problem to adapt it.

It's well worth looking, since there PC parallel port, pocket ethernet
cards are very cheap (by comparison) and it makes the whole thing VERY
attractive indeed (I'm heading this way too).

Cheers, Martin.

You beat me.. (only 2: Falcon & Mega 4) ;-) !

> A little guarded optimism is fine. Wildly inflated rumors & misconceptions aren't!

You're right - I don't disagree on that. I just think that while Atari is (like Acorn and Amiga) fighting for its survival, what is needed, is an optimistic atmosphere. One might call that false, since "times are dark". But we simply can't afford to lose people to other computers, by giving them a feeling that "everything is hopeless". You didn't mean that, I guess - but there are SO many messages in this area, just telling people how badly Atari is going... So many, that it'd be a wonder, if that didn't affect some people?
Don't you agree?

> What 'bad' things did I say about Atari computers?

I feel that we should (!) be acting together to get those long awaited Falcon games..! Sorry, but it just makes me angry to hear so damned lots of doubts and pessimism from even our "own" people. I'd understand why PC freaks would argue that it isn't much sense in writing games for Atari, or Falcon. People think that way already - as you know.

And with that attitude spreading even to ourselves - well, there won't be any Tornado flight sim for F-030, or Space Junk, or anything. I don't want that to happen - and I'm trying to fight against it. I don't want Atari community to become a tiny group of strange people who don't play, use CD-ROM:s, or do anything "normal" - but live in their own world. Sorry, if I over-reacted with your message - but you surely understand my point.

>
> When did I ever say Atari Corp is a 'miserable' company?

You didn't - but many enough people have.. So I didn't mean you by that. And: if there is enough reason - why not say things out, anyway.

> All I did was try to correct a _grossly_ inflated estimate on Atari Falcon
> sales and come to the defense of developers who YOU were accusing of not
> supporting the Falcon out of ignorance.

O.k. In Europe Falcon is selling pretty well right now. Don't know about the situation in the USA. I understand what you mean, however. Still, I have to disagree: there is lots of ignorance around Falcon. Too much.

Take MicroProse as an example: as somebody from ST-Format mag called them, asking about Falcon-support.. They (surprise) hadn't even heard that such a machine is in sale..! Well, maybe we could blame Atari itself from that - lack of information. But anyway: Falcon is very well ignored everywhere. Most programmers simply don't care - and I really can't believe that majority of them has seriously even considered the possibilities of the new Atari.
I may be wrong with that - but then: probably not. The financial side is there, too - but that hasn't stopped Silmarils from doing great work.
You, who don't own Ishar 1-2 yet: go and buy one! If you ever liked Dungeon Master - you're gonna love these, too. And Ishar 3 is on its way, too..

> You obviously don't know me so let me introduce myself. I've been an Atari

> IAAD, I've written and marketed my own commercial Atari software in 4 languages
> and like most developers, I have no tolerance for pirates or ignorance. Like it
> or not, sir, I DO have some basis of experience on things Atari. ;-)

As I said: don't take this too personally. I respect your work for Atari machines, and (as you guessed) didn't know your background. Still, I've been working with STs, Megas, STEs, TTs, and Falcons since early 1986, too - so I have my own thoughts and experiences. Maybe you don't like my way of seeing things - but instead of "realism" (accepting things as they seem to be in computer world), I appreciate an atmosphere of _trying_ to change things into something better. In this case: to get new games for Falcon-people. If that takes some watching the world through rose-colored Ray-Bans, so be it... If the result is good. There is some idealism behind the whole Atari scene, don't you agree? And there has to be it - at least a little..

> As most active participants here already know, I have and enjoy an av Mac in
> addition to my Ataris. I did finally sell that hog of a 486-66DX2, however. :)

Well, I don't enjoy Macs - no matter how hard I try... =-(The OS just doesn't feel comfortable. But technically: great machines those Quadra/PPC Macs. Wish we had that hardware in our Falcons..

> > Or this area must be renamed: comp.sys.atari.complaining ;-) ?

4896. MiNT on Falcon

Newsgroup: comp.sys.atari.st
Date: 1994-06-17 22:59:44 UTC
From: william@oslonett.no
Message-ID: <2tt9t0$6b@hasle.oslonett.no>
Source record: 185209

Does anybody out there know how I can force the MiNT version supplied with my Falcon030 not use the AES. I just want MiNT running without the enhanced desktop. (because I think I is a bit slow..)

In fact it would be even better if someone could tell me how to get to high rez without booting MiNT.

The reason for all this is that I wish to use my Falcon with either a CLI like Bash or MGR. But since the Falcon boots in low-rez, running these programs from the Mint.cnf file is a ver useful thing.

Cheers all.
william@oslonett.no

Sure, the Atari mags are literally starved for new material, just like the users. And that's great for the initial release. But for long term sales, you just gotta promote/advertise, especially when Atari dealers are hard to find.

>I am not callous... I hate to see pirated software as much as anybody -

Not as much as the s/w developer trying to feed his family, I'll betcha. ;-)

>I do not condone piracy, and I admit that I am in the wrong on this one,

4899. APL on the ST

Newsgroup: comp.sys.atari.st
Date: 1994-06-18 01:10:41 UTC
From: GARY.RATLIFF@starnetbbs.com
Message-ID: <3BC0E543@starnetbbs.com>
Source record: 185212

In looking through some old copies of START, (Since START has been out of business a while all copies of START would be old) I have seen adds for a 68000 APL interperter for the ST computer.

Is this still available? Or perhaps does someone have a copy of this system which they have grown tired of using.

The APL language was something I really wanted to try and also one of the main reasons I plunked down nearly 5 grand to buy a SuperPET (this could relate to ST as Sam was running Commodore at this time).

The implementation was great and I soom learned that a shell sort which took pages of BASIC could easily be written as a 67 token oneliner.

I do have the pd APL package for the CP/M computer which works but not having true APL character set makes the system look funky.

Quite possibly it is still available; the U.S. distributor is/was the
Spencer Organization, in Westwood, New Jersey. I got a mailing from
them within the last year or two from them, and they were still selling
APL.68000 for the ST line, in addition to Amiga, MacIntosh, and Unix
systems. I intend to try to contact them, and if there's sufficient
interest, I'll post the results, or submit for the FAQ file (or both).

The implementation was actually done by a U.K. enterprise, MicroAPL; but
Spencer was an active partner, and marketed a dedicated 68000 coprocessor
board for (gasp) PC/AT type machines at one point. I wouldn't be surprised
if one or both companies was still around, since they supported many 680x0
based computer systems, and may still have the software for sale.

And no, I've not grown tired of using my copy, although I need a new set
of stick-on keycap labels.

On my Falcon (TOS 4.04) and another one I use daily (TOS 4.02) I find that
LZH Shell v3.10 can't deal with files that have been downloaded wherein
the CTRL-Z padding remains appeneded to the end of the file. If I drag-
and-drop these files onto the Shell program, it reports the garbage-at
end-of-file stuff, then the shell window freezes before it's even half
displayed. I have to run the program, then select the .LZH file.

SLASHCONV worked until mupfel/gemini 1.21.

> I don't know. If you find out, could you please let me know...? I've been
> searching for this possibility too, but haven't been able to figure it out (if

"set -S" allows you to *type* Slashes instead of Backslashes but they
get converted to Backslashes before calling the program. So this
option does only half the job. If you want to get a real shell, have a
look at tcsh, ksh or bash.

Bye,
Knarf

That wouldnt happen to be for a cracked version would it?
If you have a legit version you could get a manual from spare parts easy.
Would cost you maybe $20.
If you have a cracked version then seriously consider going legit. You
can pick the software up second hand for a song.

Source record: 185232

Could someone tell me if SCSI out and DMA out are a function of the
interface (such as the Link) or is there a simpler way to add more SCSI
devices to interface cards that seemingly have only one SCSI output?
If it's a function of the card could someone suggest adaptor/s that are
available in the UK that have both SCSI and DMA out on them please.
If it's otherwise could someone tell me how to do it? ;)
Finally ;), is it possible to get an apple cd 300 working on an ST via SCSI?

Thanks,

Paul.

NeoDesk 4 supports MultiTOS. That is why it works with Geneva (since
Geneva duplicates all the MultiTOS AES features). In theory it should
also work with any other multitasking environment that follows Atari's
multitasking standard. Does Mag!X do this? If not, is there a developer's
reference or such? I guess if Magi!X doesn't follow the standard and has
its own, we "could" support it, if we can find out "how".

For C++, there is a truly awesome class library called GEM++, which
makes GEM programming much less painful.

For C, there is GEMFAST, which does some things nicely, and some things
strangely.

GEM++ and GEMFAST are available on atari.archive.umich.edu and its
mirrors in the Programming directory.

On German FTP sites, there is also e_gem, and a few other GEM libraries
that I don't know about.

Strange my MicroEMACS handles literally *any* screen size... Then
again, it's 3.12 compile for MiNT, and doesn't run under TOS (which is
why I've never uploaded it to any FTP sites).

> I use jove, because I don't have enough memory for 'real' emacs. Unfortunately,

Is the function not there, or is it just bound to a different key? You
could email the current JOVE maintainer, he's working on the source
right now.

I was going to make a stab at porting it to the Atari, but I just don't
have enough time.

> If it's otherwise could someone tell me how to do it? ;)
> Finally ;), is it possible to get an apple cd 300 working on an ST via SCSI?

In the case of ICD host adaptors (and probably most adaptors in general),
you connect a SCSI _bus_ to the 50 pin flat SCSI connector, and then there
are DMA in and out plugs on the card (facing out of the hard disk casing,
usually). A SCSI bus can include an external SCSI plug (which should also
point out of the case) for hooking up an external SCSI device. Here is a
picture:

```
In Out
+-| |--| |-+ <- DMA ports
| |
| host adap |
| |
+--| |--+ <-SCSI connector for 50 lead flat ribbon cable
| |
\ \
\ \
\------\ <- some number of 50 pin flat connectors for
\ \ SCSI drives in the case, connected to drives or empty
\------\
\ \
\ \
|XXXXXX| <- external SCSI connector, facing out of the case
```

So, the first thing to note is that you can connect several drives to the
one SCSI bus connector on the card, by using a SCSI ribbon cable with more
than one 50 pin SCSI connector on it. In addition, you can also have an
external SCSI connector on that cable, facing out of the case so you can
hook up any standard Mac/PC/etc. external SCSI unit. In the picture above,
you would have to have an external terminator on that final plug, and all
the devices internal to the case would have to have their terminators
removed. The external SCSI plug could be in the middle of the chain somewhere
as well, which would change the termination characteristics. I have seen
Toad drives come with a internal SCSI bus that has an external plug in the
middle, which points out of the case.

The typical limit for SCSI drives on one host adaptor is 8 (ID 0-7), though the card might reserve some of those IDs for special purposes (the clocks on some ICD host adaptors use ID 6, for example). You can use multiple host adaptors if you so desire, but I think you are still restricted to a max of 8 SCSI devices on the system. Of course, they need to be set to different SCSI IDs, or they will conflict.

So, I think the answer to your question is that you can add up a bunch more devices, internal or external, using the card that you have. You just need to get a new internal SCSI ribbon cable (which is the SCSI bus, by the way). I presume you could have one custom made with whatever connectors you want on it. I suggest at least three internal connectors (with plenty of excess in between the connectors) and an external one. I would probably put the external one in the middle somewhere, so you don't have to worry about termination.

4921. Latest ICD software (really)

Newsgroup: comp.sys.atari.st
Date: 1994-06-18 15:25:23 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2tv3l3$dka@mailer.fsu.edu>
Source record: 185235

Ok, an amendment to my previous post. The latest ICD software that one can get from Genie is 6.4.3. The latest software that one can get from ICD via regular mail (and $15) is 6.5.5. This is the non-Pro level software. Software upgrades for the Link and the Pro level are also $15 direct from ICD. ICD operates a BBS which should have the latest non-pro level stuff, and possibly the Link stuff, but as it always seems to be busy (in a non-operational way, I strongly suspect) I cannot verify this.

I received some hints via email that ICD may not want to send updates to the online services anymore (i.e. Genie). As they don't seem to be too concerned about fixing their BBS (given that my suspicion about it being broken is correct), this leaves the $15 and US mail route. While I personally don't mind paying for these updates, I suspect that one of the following is true:

1. ICD is no longer going to post updates to Genie. If so, they should have posted a notice saying this on Genie, with instructions on how to obtain them via snail-mail, and regular postings announcing the new versions. If they are interested in generating lots of "pay upgrades", it is extremely silly of them to not do this. Also, the doc files that have come with all ICD software (including the latest 6.5.5) specifically state that the latest upgrades will be available from Genie. If that is no longer their policy, the doc files should be changed.

2. ICD is being very lazy about posting updates to Genie. If so, they should get their shit together. Genie uploads are free and the call is probably local for them, so I see little excuse for this. I would suspect that there were some intermediate versions between 6.4.3 and 6.5.5, and it appears that none of them got uploaded either.

Just my $0.02. Needless to say, if I am right about either of the above, the chances of my getting permission to put ICD software on atari.archive are rather slim. I will still make the attempt.

> way around, I had problems, because I was moving to a less powerful
> machine (Amiga -> ST). I shall qualilfy that... less powerful for coding
> my football games.

Haven't you removed the 4 meg bug, Dino? I borrowed Goal (albeit it "buggy" version) from a mate to see what it was like and it took me ages to find out why the damn thing kept crashing when I moved the mouse pointer (ooer, another oddity there - the manuals says you can use the mouse, but you can't) near the bottom of the screen. It also bombed when the game went into "wide" view.

So, okay, the number of people with 4 meg STs is pretty limited (%age wise) but somebody should have tested it out.

And also the references to "DF0" annoyed me too... Not enough time to change it to "A:\" or something I suppose, eh? :)

Needless to say I was not impressed and didn't buy it. (KO2 is still my fave footie game, along with Player Manager)

Col.

the only bug I've noticed is when it reports that there is garbage in the
archive and you have it installed as an application... you double click
on the .LZH icon, only to have the lzh shell run and tell you there's
garbage... this is fine, but in the process, the silly thing doesn't
draw the background in, and you have no idea where to click the mouse-
button!

It works fine when you run the program first, then select the archive
though. Strange.

>going to buy Goal but the two reviews I've seen so far gave it 48% and 60-odd%,
>not high enough for me to part with twenty-odd pounds for a game.

The gameplay is identical to the Amiga version, which got review marks ranging
from 82% (from Amiga Power, not renouned fans of my games) to 93% from
CU AMIGA. Why the two reviews you mention gave it so low marks I can not say
... if you liked the original on ST, I can assure you that GOAL! is much
superior. The reason for the low marks is probably because the game does not
look that great graphically - it can't when I'm running the game at
50 frames per second. But there again the Original KO ST ran at 50 FPS
and looked pretty much the same. I chose to keep the gameplay rather than the
graphics... not always a popular choice with the press, though I've found
always the most popular with the buying public in the long run.

I have not seen any ST reviews, so I can not comment on them individualy.

The Game recently won a major award in Europe.

Oh, and remember, the original Kick-Off got poor reviews when it came out.
Sometimes it takes a while to educate people ;-).

>anyone tell me how to connect up the pins?

Now that we are on the subject of extra joystick adaptors, I would
like to take the opportunity to plug three of my games.

As well as using the same adapror as used with Gauntlet for adding
two joysticks to the printer-port, if you have an STE or Falcon,
use is made of the joystick ports at the side to add four joysticks,
giving a total of eight joysticks.

The game are all available on atari.archive.umich.edu in
/atari/Games

These are the latest versions, and can run on the Falcon (you
may need to use backwards).

They are:

Linecrash (linecras.zip) 8-player Tron Lightcycles
Mazewar ST (mazewar.zip) Shoot your opponents in a maze
Pacmen (pacmen.zip) 8-player pacmen with missiles.
A.S.S. (comming soon) Enhanced M.U.L.E. for 8 players

Each zipfile contains the complete instructions for building your own
adaptors for both types of joystickports, as well as how to use them in
your own games.

Does anyone know a complete list of games that make use of these adaptors:

The only ones that come to mind at the moment are:

printerport adcaptor:

Gauntlet II (commercial)
Leathernecks (commercial)
Projectyle (commercial)
Spacewar 2000 1.1 (shareware, available from all good FTP sites)

STE port adaptor:

Apart from my own games, I do not know of any other games that
allow you to plug in lots of normal joysticks into that port.
I think that Dynabuster might.

Andrei.

4927. Games on STE (Was: Re: Gaunlet II)

Newsgroup: comp.sys.atari.st

>(Tos 1.62) and it wouldn't
>work at all. Would get to the title screen and then crash as loading
>continued. Both machines have 1 Meg.

When the STE was released, it was released with a diskdrive that
could only read 82 tracks. Gauntlet II might use more than that.
This is the reason why loads of games do not work on the STE.
Copy protection m,ay also be to blame). This may not explain
why the game doesn't work on the STE, but this explanation holds for a
lot of games. You might want to try and get hold of a pirated version.
I know that technically, this is illegal, but if you already have a copy of
the original program, then I think you are allowed to own the pirated
version if it works on your STE and the original doesn't.

Another reason (applies only to owners of 512kb STEs) is that due to
the larger size of the operating system, the STE needs 1 megabyte to
run programs that run fine on 0.5 meg STFMs.

I remember when the STE was first released, all the magazines
seemed to think that the incompatabilities were solely due to the
differences in the TOS. I remember writing to 11 computer magazines
telling them about the diskdrive, but only one of them published
my letter.

The reson why there are not enough games for the STE was that the
magazines often wrongly insulted it.

AE.

4928. Re: STOS does not work! HELP!

>
>Im using TOS 1.4 (Rainbow) on a 520fm w/ 2.5 megs ram.
>
>PleasethelpasohIvcanmwritedsome nifty software with it.

Which version of STOS are you using?

When STOS was sold, it was version 2.3
This version does not work on machines greater than tos 1.2

There is a patch available that can make STOS work on machines
up to and including TOS 1.62
(there also exist patches to make STOS work on higher TOS versions)

The patch is called stosup26.lzh

It is available from atari.archive.umich.edu in /atari/Languages
or ftp.uni-kl.de in /pub/atari/programming/STOS/patches

This will upgrade your version of STOS to version 2.6

If you want to run a program written in STOS that does not work on your
machine because it was compiled with an old version of the compiler,
you can run a program called stsfx27a.lzh which is found in the same
directories on the same FTP sites. This will make the program work on
any version of TOS (even on the Falcon), but it will then only work on
the same version of TOS that you ran stsfx27a.lzh.

Hope this helps.

Andrei.

PS. There is a STOS mailing list. For more details, write to
ma2ljg@midge.bath.ac.uk

PPS. There is a STOS ftp site at ftp.uni-kl.de in
/pub/atari/programming/STOS

I didn't find Hermes that hard to install. And you can always consult
the writer of Hermes if you have problems. If you do this often, maybe
he'll write the docs in english eventually!

Forget Mercury; it's old, unsupported. Hermes is the successor of Mercury.

I also noticed that when making an archive of quite a few files, the 'garbage' dialogue came up at the end. Is this a case of poor error checking?

This dialogue also came up when uncompressing some archives, but the uncompressed files were quite ok.

Weird.

Date: 1994-06-18 22:29:48 UTC
From: vicb@clark.edu
Message-ID: <2tvsgs$ecg@clark.edu>
Source record: 185245

I've decided to add a hard drive to my system, and have a question or three...

I've seen a setup for sale consisting of a case, power supply, fan, Supra host adapter, DMA cable, and Supra utilities to go with the host adapter, for around $100.

a) is this a good deal?

b) I didn't know Supra ever made host adapters; are they comparable to ICD in terms of quality, reliability, and overall niftiness? (I don't know what type of Supra it is...)

c) Is it possible to plug any SCSI mechanism into this setup (assuming it will fit)? I've also seen SCSI drives out of old Macs or other systems, and want to know if they would be usable.

d) Anything else I would need? As I understand it, I wouldn't need a separate controller if I got a SCSI unit.

Thanks for humoring me in all of my ignorance...

Both GEM-View v3.xx and Big-Convert will do that. Big-Convert I found at ftp.cs-tu.berlin.de in the pub/atari/Graphics/ directory filename is something like bconvert.lzh. Be warned, Berlin is _SLOW_!

GEM-View is at atari.archive.umich.edu in atari/Graphics/Gemview/ under various parts.

Has anyone managed to get this program to work, at atari.archive.umich.edu
it is:

-rw-r--r-- molin 72070 Jun 16 00:16 ./Graphics/face.zip

(atari/Graphics/face.zip)

The program runs (Monochrome only apparently), but then an alert
appears claiming "File was not open" (or something similar), then gives
me a file-selector looking for '*.BAS' files.....

This gives me the idea that it is a GFA v2.xx program, which doesn't like
something on my system, or just plain doesn't go. (And I tried running
it with nothing but the ICD-Booter and Sebra v1.33 (Very good Monochrome
Emulator)).

It looks like a'IM.w&2[I}wd!_m_N{}u}
7jpc]\{6&H

Ahem...

It looks something like the old "Fun-Face" program, but this apparantly
animates facial features. (No doc's but there are half a dozen *.ANI
files and other hints at this!)

>continued. Both machines have 1 Meg.

I could not get Gauntlet II to work properly on my Mega 4 ST (TOS 1.2). It would play fine for a while then suddenly it would bomb and lock up. I could not determine an pattern. I return the game to my local Atari dealer (Who has since stopped selling Atari stuff. Didn't like them anyway.) and got a refund.

Good luck,
Steven Whatley

Sorry Hutch but they are not active on GEnie, their software and Information on there is old old..

To me this is not support....

Plus their BBS only runs at 2400, they are using old PEP type modems...

> adapter, for around $100.
>
> a) is this a good deal?

It depends on the case. I wouldn't pay very much for the Supra host adaptor
(see below). I would try to build in some expansion room, as I find
megabytes to be roughly like potato chips ("You can't eat just one....").

> b) I didn't know Supra ever made host adapters; are they comparable to
> ICD in terms of quality, reliability, and overall niftiness? (I don't
> know what type of Supra it is...)

The ICD software is a _lot_ better, IMHO, and is still being updated and
developed. On the other hand, you could purchase the ICD Pro level
software, and it will work on the Supra host adaptor. I think it is around
$50, so I would definitely work that into the price. I have never heard
anything bad about the Supra hardware, its just that the software is ancient
and does not support the newer AHDI/BGM style partitions, which is important.

> c) Is it possible to plug any SCSI mechanism into this setup (assuming it
> will fit)? I've also seen SCSI drives out of old Macs or other systems,
> and want to know if they would be usable.

I believe the Supra card requires no parity on the drive. Most drives have
a jumper for this, but some require a SCSI command to set parity (which
requires something that works with parity on). Macs generally use parity,
so be sure the disk has a parity jumper. Some of the newer Quantums are
the ones that don't have parity jumpers (I have heard of no other brands that
are doing this). The ICD Advantage and AdSCSI cards will work with parity
on or off. The ICD Link requires no parity, the Link II works with either.
Other that that, just about anything will work.

> d) Anything else I would need? As I understand it, I wouldn't need a
> separate controller if I got a SCSI unit.

Nope, you'll be set as far as hardware goes. Again, I strongly recommend
ending up with something running ICD software, either by purchasing an ICD
host adaptor card (which will come with the software), or by getting the
ICD Pro level software. Just my $0.02.

I just tried it, and it works perfectly on my system given that I put it
in a folder called FACE on drive A. It apparently has paths to some of the
facial pieces hardcoded in (which a sector editor can probably fix). This
was on a MegaSTE, in mono.

> It looks something like the old "Fun-Face" program, but this apparantly
> animates facial features. (No doc's but there are half a dozen *.ANI

It is a bit weird, but looks like it would be fun to play with while
indulging in adult beverage (actually, after having indulged would probably
be best).

Several people have noticed this. Do you use TOS 1.62?
I have a TOS 1.6 machine, and LHARC shell works fine with neodesk,
whereas my friend has 1.62 and his shows up this bug.

Hi,

I just dnloaded the Pinball game from A.A.
called StarBall.zip..

It looks very good, and is Falcon compatible...

Are there any other games from this company...??

Volume 11 Software Development,
PO Box 311,
Preston
PR3 5DZ
(England)

STARBALL FEATURES:

Main playing area of 204,800 pixels
More than 24 screen colours
Three sets of flippers
Stunning sound effects (for an ST)
No PSG music (so you can enjoy a good CD rather than dodgy ST tunes)
Over 32 sprites on screen
3 amazing bonus screens
1 amazing secret barking mad bonus screen
LED Scoreboard
Rolling intro
Lots of surprise bonuses
Real-time SuperFlip Technology (on > 512k machines)
Quality soundtracker introduction
More than 1.2M of compressed data
Largely O/S cooperative
Just about fits in a normal 520ST (in an AUTO folder)
Hard-drive installable
Source code available
Falcon compatible with Enhanced Falcon Features:
Ultra-smooth 50 frames per second operation
Compatible with VGA monitors at 24 frames per second.
Soundtracker music at 50 and 25 kHz during play, your choice of music!!

Worth the dnload time.....

: >(Tos 1.62) and it wouldn't
: >work at all. Would get to the title screen and then crash as loading
: >continued. Both machines have 1 Meg.

: When the STE was released, it was released with a diskdrive that
: could only read 82 tracks. Gauntlet II might use more than that.
: This is the reason why loads of games do not work on the STE.
: Copy protection m,ay also be to blame). This may not explain
: why the game doesn't work on the STE, but this explanation holds for a
: lot of games. You might want to try and get hold of a pirated version.
: I know that technically, this is illegal, but if you already have a copy of
: the original program, then I think you are allowed to own the pirated
: version if it works on your STE and the original doesn't.

: Another reason (applies only to owners of 512kb STEs) is that due to
: the larger size of the operating system, the STE needs 1 megabyte to
: run programs that run fine on 0.5 meg STFMs.

: I remember when the STE was first released, all the magazines
: seemed to think that the incompatabilities were solely due to the
: differences in the TOS. I remember writing to 11 computer magazines
: telling them about the diskdrive, but only one of them published
: my letter.

: The reson why there are not enough games for the STE was that the
: magazines often wrongly insulted it.

But I've got one of the first STE's and it reads and writes all the way up
to 84.

This isn't an early STE though since it's got Tos 1.62.
And Gauntlet II works fine on mine.........

Strange,

Paul.

I think the reason for the low ratings was because the early version was too
buggy - according to STF you were lucky if you could get through an entire game.
Nice to hear that this is all fixed now - just make sure the mags know, perhaps
they'd re-evaluate it. At least try and get it mentioned on the news pages, so
people who aren't on the internet know........

That's strange, I still haven't seen an Intel box that could play an
MPEG at a reasonable frame rate without dedicated hardware; I suppose a
Pentium might, but I don't think a '486 can get anywhere near 30
frames/s.

Yes that would make sense. It would make sense to everybody wouldn't it?
It's a shame that Virgin seem to have the policy of keeping it as quiet as
possible so that they limit the number of disks they have to change. Same
thing happened on the Amiga version when I introduced version 1.1 with the
cup competition. That was released last Autumn and I still hear people saying
"... but shame it does not have a Cup Competition".

Argh. Why is it that anything large I send to atari.archive ends up corrupted? I *always* transfer in binary mode (my ftp client automagically sets it to binary when it detects a UNIX host, _and_ I always type binary as my first command).

Unfortunately, you'll have to wait a week before I an do anything about it; I'm on vacation this week. I'll download one of the files to test it, and if it's munged, I'll rebuild NetPBM. I'll warn you though, the new version will be MUCH smaller, but it will _require_ a minix partition to install it.

AFAIK GNU Pascal is p2c, the Pascal to C converter; I think Warwick just
built a version that works well with Heat & Serve C on atari.archive...
I don't know whether or not he sent it there.

awk will be in gawk*.zoo in the Gnustuff/Tos/Gawk directory on
atari.archive.umich.edu; there might be a MiNT-specific sharable
version somewhere too, but that's only necessary if you'll be running
lots of awk jobs at once and memory is scarce.

sort is probably in the GNU textutils, look for txtutl*.zoo in
Mint/Utilities on atari.archive.

From: azog@world.std.com
Message-ID: <Crnz8o.1wB@world.std.com>
Source record: 185032

I know this question has been asked a bajillion times, but I have yet to see a satisfactory answer.

Whats it take to get a 'regular' 3.5" drive on the IDE bus of the Falcon? I looked at the cable for the internal 2.5" and noticed its different, so I cant just yank that and replace it with a dual node cable. I would even consider taking the 2.5" out in favour of a 3.5", since I have three 340mb drives here acting as paper-weights that I wouldnt mind using in my Falcon.

4979. TT/SLM Laser/Page Stream

Newsgroup: comp.sys.atari.st
Date: 1994-06-19 23:23:00 UTC
From: mike.hill@cccbbs.cincinnati.oh.us
Message-ID: <16234.264.uupcb@cccbbs.cincinnati.oh.us>
Source record: 184809

All,

I have an Atari TT with 2 Meg ST Ram and 20 Meg TT ram. I also have an SLM804 laser and use Page Stream. Recently after upgrading from a Mega STE to the TT I found the big problem that 2 Megs of TT ram isn't enough when using the Atari Laser and Page Stream. The problem is that the Laser needs ST memory for its DMA (roughly 930K). To do this Page Stream must load in ST memory and the Printer driver most have its flag set to use ST memory. This makes doing anything useful with Page Stream very tough. I tried using the print to disk option with the Diablo Emulator driver, and the direct SLM driver but neither will print to disk.

So my big solution was to grab the source code to the drivers (Softlogic placed the sources to all import/export/printer drivers for Page Stream version 2.XX for the Atari and Amiga's on Genie). I rewrote the driver for the diablo (you don't need the emulator loaded for this one) so it supported the print to disk. I then wrote a small external program that supports printed these disk images to your SLM laser.

Everything works great. I can now set Page Stream to use my TT ram and not worry about memory problems. I print my disk images to the hard drive and print them out with the external program. The external program only needs about 1 Meg free in order to print (thats ST memory) so it is no problem. I would suppose this program would help TT/SLM users who even have 4 Megs but run out of space quickly. (Those graphic files can eat up memory).

If anyone is interested in testing it please drop me a line at the below address. It isn't fully tested yet and has some limitations. It only works with Lasers that are ID #7, you must print each page separately to different disk files, it isn't a fancy GEM program (just pass it the filename and let it go). I plan on doing the above enhancements and some other stuff, after I know if there is interest in it. The program will be freeware when finally released.

Some other programs I have in the wings....

FLI/FLC/DL/GIF viewer. Views all mentioned formats and supports scripting with DMA sample playback also. Has special support for Crazy Dot/Cyrell/Nova graphic cards, and also works on TT/Falcon 256 color modes. Views every FLI/FLC I have found (I have about 30 meg) and does it fast. The GIF viewer has been reported as faster than Speed of Light by my beta testers. Support for GL files, FLX, and Possibly AVI (if some kind soul sends me format info on it!). (By the way Speed of Light is an excellent product. It does alot of very

nice things very fast. My program is geared as more of a program
to view animation and be able to create scripts. As such it doesn't
support resizing or any of the other powerful features of SOL.

Disk Librarian Program: Gem proram that lets you catalog your disk
library. It can read disks in a variety of ways. It can be set to
only log files with extensions you setup. (You may only want to
get certain extensions and want to leave out RSC files for instance)
You give generic descriptions to the extensions you want (for ZIP
for instance you might say "Pkzip Compressed File"). When it finds
files on the disk with that extension it logs the disk number/file size
/filename/date/and puts that generic description. You can also set
it to recurse or don't recurse sub directories. You can also tell
it to log all files regardless of extension (it will still put in
your generic descriptions for various extensions you set up). You
can set the above options in any configuration you want. You can
sort/edit/view this information and save it to disk. You can export the
listing as an ascii file, or print it to your printer. The program
also supports label printing so you can label all these disks you
catalog. Right now I need to finish the labeling code to support other
label formats and printers. It only does the labels right now that
fit on the front of a 3 1/2 only.

Anyway if you want to try the Page Stream printer driver/print program
drop me a line at one of the below addresses.

Source record: 185047

In comp.sys.atari.announce, ringo@lexicor.com writes:

>MC 68040 at 64 Mhz
>Internal FPU (Math Co-Pro) and PMMU
>Performance is around 26 MIPS, 4.5 MFLOPS
^^^^^^^^^^

How was this measured?

Looking at the math speeds against the TT, we find:

>Math Routines: Medusa 0.93 (1780%)
>==========================
> TOS 301 (TT/fastram/cache) : 03.13

A TT gets under 0.6 MFLOPS. The Medusa rates 3.13 times faster for math operations. Therefore, the Medusa should only be about 1.9 MFLOPS.

Your MFLOPS figure is WAY OUT.

Please give references to what tests where used `Performance is around' is very dubious.

(this is one problem with comp.sys.atari.announce - no follow-ups)

Not Heat & Serve. Sozobon. I tried to do it with H&S, but it crashed on
many things (don't remember). And I never uploaded it: my SO was using it
for her Uni work, but semester has finished, and she really hasn't given it
much of a test run (did one assignment, with complete success). Anyone
could repeat the work though - it's just a trivial recompile of the p2c
library.

From: Graham.Irvine@mettav.royle.org
Message-ID: <772165396.1@mettav.royle>
Source record: 184988

It was none other than Keith Bedford that wrote on 15 Jun 94 that ,
KB> I'm looking for opinions on the 'best' ST WWII flight-sim.
KB>
KB> I can get Reach for the Skies, Their Finest Hour & Dogfight locally,
KB> any opinion on a ranking?

I have the first two which are remarkably similar 'Battle of britain' sims and I'd rate the former 'Reach for the Skies' higher in term's of speed and implementation ... It doesn't suffer TFH's slow frame rate which nearly stops if you leave the sound effect's on during a dogfight :-(TFH might be better on an accelerated machine ...not much between them in the graphics or playability dept . Oh and RFTS doesn't like TOS2.06 and I would imagine latter ones either .

Dogfight I don't have but I don't think is a strict WW2 sim anyway but more a multiplane ...eh Dogfighter :-)

4989. Re: GOAL! - buy this game

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 05:28:36 UTC
From: Graham.Irvine@mettav.royle.org
Message-ID: <772165396.2@mettav.royle>
Source record: 184989

It was none other than Dino Dini that wrote on 15 Jun 94 that ,

DD> a game retailing at about 30 UKP) of around 2 UKP a copy. So the
DD> whole deal is worth 6000 pounds.
DD> The conversion is likely to take 3 - 6 months, for which 6000 is not
DD> a lot.

No Good at all I agree . But IF someone was prepared to take that risk for you ...say PAY you an advance to do the work (and of course reap the profits IF it outsold your expectation's :-)) What would be your objections to that ? (or indeed Virgin games who presumably have you tied to some sort of contract ?) And maybe as a benchmark what would you want to do it :-)

The other angle is that what would stand in the way of say if you (and i am talking generally about commercial games developers) didn't want to convert it handing the project over to someone else to do it for you . Obviously then you wouldn't have to spend any time on it but would receive presumably some either payment for the source OR a royalty based payment. Now I can envisage a lot of legal and other problem's here but what is your feelings about this ?

Of course even if all the problem's etc could be surmounted I guess the biggest one would be finding someone to take any of this on ...
but HEY one step at a time !

> of my CD player but the output was too loud for the falcon and I wound
> up getting distortion.. so then I tried using the headphone jack on
> a low volume setting with the ground loop isolator in between..
Well, I had the same problem when I connected my Falcon to my stereo. Then some people told me to unplug the antenna-cable of the tuner, and that helped! Maybe you should try this...

About the too high input when using the line-out of your CD-player: Use a cable that has some resistors (about 100 Ohms), this will lower the output of the CD-player to an (for the Falcon) acceptable level.

Hope that helps

Ciao

Thomas

4994. Starball (Was Pinball Game)

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 09:17:40 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <2u3mrk$lc@m1.cs.man.ac.uk>
Source record: 184813

Wow it's glad to know that withing 24 hours people are spotting it and appreciating it (before I even had chance to publicise it here somebody beats me to it)!

At the moment it's our only game, but hopefully I will receive enough money from Starball to fund another project (aiming for roughly December I would have thought). Unfortunately, since I cease to be a student in a few months time, I won't be able to continue writing games unless people donate money for this one....

Anyway Starball is available now from atari.archive.umich.edu and it's mirrors (src.doc.ic.ac.uk in the UK is the one I usually use), it makes use (I won't say GOOD use but it does at least make use) of Falcon features and hardware, and I hope a lot of people out there will at least take a look at it. And some might even send some money! (and I can pass on the source code if you do....)

Hope everyone enjoys it
Dave Oldcorn, V11 Software.

>

I'll try this, but I'm sure I tried practically every combination! I'm
running a file called TRON1MEG.PRG, is this the only version?

Actually, I think I always selected the CPU at 8MHz assuming that
this would work and exception tables moved. I'll try again!

Does anyone have any comments on Llamazap? Will this ever get released?
Are any companies planning Falcon only versions of some of their games?
If they are planning ST versions then I'm only interested in better
graphics and sound in the Falcon version, at the moment.
Surely this would simply require the graphics and sound engines re-writing
and using the images and samples from the PC versions. In fact the
code should be smaller because their is only one graphics and sound
choice for any Falcon games. 16 bit stereo DMA sound and 256
highest res. colour. True colour isn't really necessary since
most PC-VGA games only have 256 colours.

Production costs would mean making a run or two of the Falcon disks
and sticking labels on the boxes with Falcon Only written on it.

I suppose that ST production of games is at an all time low now and so
Falcon games will be very hard to come by.

Even an high-tech music shop I went to recently only had one PC (plus
52 cards!) controlling their keyboards and synthesisers. I assumed

there would be at least one Falcon or ST.

I'm getting very depressed at Atari's home computer scene. Games magazines don't cover ST or Lynx games and are only talking about Jaguars. The UK games market is still waiting for the Jaguar to be "offically" released. Without an official release I don't think anyone here will actually believe it exists.

(sigh)

Hello again, folks

Just a post to inform you that the latest version of 2-in-1, the
all in one archivers shell, is now available at micros.hensa.ac.uk

It is in the path...

micros/atari/tos/n/n140/2in1107m.lzh

This is a maintenance release over the last one...v 1.06e, and includes:

- Updates to the English TWO-VIEW documentation explaining how to set
up Two-in-One to call external file viewers, an exciting new option!

-Minor change to 'TWOINONE.PRG' and 'TWOINONE.SYS' to correct a
problem

- An updated 'TWOINONE.HLP' file which now works correctly! We
recommend changing over to the more complete on-line help provided
using ST-Guide and the 'TWOINONE.HYP' file, unless memory is tight.

- Minor updates to the other English documentation.

Just a part of the service i hope to increase.....

Danny

I've used about 4 different STEs and never had any of them
unable to handle more than 82 tracks. While I normally
don't format disks above 82 tracks, I have formatted disks
up to 85 tracks on all the STEs (and STs) I've used. While
I have heard several reports from some STE users saying
that their machines don't handle disks with over 80 tracks
well, they SEEM to be in a minority.

I don't know about that specifically, but Atari changed a few
things in TOS 4.xx that causes some applications (STalker, for
instance, to not handle printing routines correctly). There's
a shareware fix called TOS4TRAP that fixes that problem, but I
don't know if this is the same problem with GFA's LPRINT
command.

Last year I remember reading about two cycling programs for the ST in a PD catalogue. One logged your riding/training and the other calculated gear ratios. I have never heard of or seen either of these programs since. Does anybody :

a) know what they're called
b) know what PD library has them
c) have them themselves and be willing to pass me a copy
d) know and FTP servers which have them ???

I would be grateful for any information you can offer. Please mail me at :

crm-a@minster.york.ac.uk

Cheers,

Chris.

Actually, I'm using TOS 1.02 (MegaTOS). Evidently I read that it has
something to do with using Turbo ST (or any screen accellerator?) ...
apparently that's what's causing the problem, though I have not yet tested
this hypothesis.

Well, I didn't say it plays them at a great speed, but I
suppose "adequate" describes it on a 486/33 (with the occasional
"stutter" as it's trying to keep pace). I think the player requires
the Win32s package to be installed as well (the software that fakes
the Win 3.1 to using *some* NT/32-bit stuff)...

I imagine a TT could probably do a good job - dunno bout my
MSTe tho...

How will this help ? You said that the Falcon tries to load AHDI and that's
right. So the Falcon will ALWAYS try to boot from IDE.
By the way, there is also a config program for AHDI available.
I think it's named AHDICNFG.xxx or something like that.

>The Gfa basic command LPRINT doesn't work on the Falcon.
>
>I've been told that there is a BIOS call which can replace LPRINT.
>

Easy way to get around the lprint problem is to use the following:

OPEN "O",#1,"PRN:"
PRINT #1,"the text you want printed goes here"
CLOSE #1

Of course you can do as many PRINT #1 commands as you like before closing
the channel.

For even easier use, make a procedure:

PROCEDURE printl(t$)
OPEN "O",#99,"PRN:"
PRINT #1,t$
CLOSE #99
RETURN

And then use:

printl(text$)

instead of

LPRINT text$

Play something through your Falcon, or just listen to the hum and
then turn off your monitor. I find that my RGB adds an unbearable amount
of noise (a steady hum that shows up on the DMA oscilloscope) while my
SVGA induces only a very small amount of noise. When my monitors are shut off
I get NO NOISE! Plugging the monitor into another wall soket should help I
think. The monitor interference is propably what caused ALL of the
mysterious 'humming' Falcons.

(I have my RGB connected to the same power bar as the SVGA and when both
the SVGA and RGB are on, the picture on the SVGA is jittery.)

Hahahaha... that could make things really interesting, eh? Just watched a rather poor B-grade movie last night called 'Arcade' which literally absorbed the player into the _game's_ reality. Plot was really awful but some of the arcade graphics were top notch, albeit not enough of them to make up for poor acting.

Tommi, thanks for sharing your views and comments. My last post sounded a bit self-serving and indeed, overly-defensive. I apologize for that as it wasn't my intent. My suggestion to all who want to see more games specifically for the Falcon is to BUY the games you do find and to write to the developers/publishers encouraging their support.

Nothing speaks louder than your dollars (pounds, yen, rubles, etc). :)

For those who want to know the facts about where Atari is heading, obtain a copy of their last stockholders' report. You'll find it, er, enlightening.

Cheers,

-Hutch- @ Fair Dinkum Tech

The Quantum 240 is a very nice mechanism, Roger, but how about the following?

APS Technologies, a large hard disk supplier primarily for the Mac market, has announced availability of the Quantum ProDrive LPS 525S, a 525Mb SCSI hard disk in 3.5" 1/3 height form factor (will fit in the Mega) with 9.7ms avg seek time for only $379. That's a good deal, people. Heck, I bought a 340Mb drive for about that just a couple of months ago. This drive mech should be available from other sources (like Toad in the US) but just in case, the APS address is:

APS Technologies
6131 Deramus
Kansas City, MO 64120
800-677-3294

International Sales: 816-920-4109 or fax 816-483-3077

They have separate numbers for French, Spanish, Italian and German, too.

Me, I'm saving for their Quantum Q1080 (1.08 Gb) drive for $749. :)

The evidence I have I consider irrefutable. However, I also have it in
confidence so unfortunately, I cannot share it for your verification. Sorry.

I am frankly amazed that Bob Gleadow would actually go on record with that
kind of number but that's his business and perhaps _he_ was misinformed. I
am NOT implying he was lying, of course. ;-) BTW, could you give me a reference
to the magazine article (?) in which he made this claim? Thanks.

Feel free to believe in whatever pipe dream strikes your fancy as I cannot
offer any proof. And to be honest, what does it really matter anyway, eh?

I would be curious, however, in finding the highest serial numbered Falcon
from among all Falcon owners who also read this newsgroup. The last I heard,
all Falcons were still being serial numbered sequentially.

> with no problems.

Just a quick note: the program DC MaxTracks can positively tell you how far out your floppy drive can format. I mention this because lots of formatters don't verify their format, so just because an 83 or 84 track format seemed to work does not mean that data can be reliably read/written to those extra tracks. This program is available from atari.archive. It is designed to find out this information (it is not a general formatter like DC Format, which is a fine program as well). I have a buddy that intends to have a floppy drive repaired, and I suggested that he send a copy of this program along (and demand that a drive be installed that goes out to at least 83 tracks reliably). I am in the market for an external floppy, and I intend to do roughly the same thing. So, this is a handy tool to have lying around, IMHO.

>people who aren't on the internet know........

Yes, let's hear again from STF, STU and STR - if it really has been fixed,
then maybe I'll try and find a shop that will let me play-test it. If it had
been fixed when it first came out, I'd have been able to afford it then and
there, unfortunately however, my contract runs out on Friday and then it's
a case of

sign on, sign on,
with pen in your hand,
'cos you'll never work again,
you'll never work again.

Well, hopefully the above isn't totally true but no new job yet. Me and several
thousand recent graduates....

5034. Apple Power CD

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 16:52:25 UTC
From: P.A.Booth@bradford.ac.uk
Message-ID: <1994Jun20.165225.27515@bradford.ac.uk>
Source record: 184850

Is it possible to use one of these like a personal CD player?
I.e. does it run of batteries?
How would you get one working on an ST? Is it feasible?
Erm, is it multi-session? (and what exactly does multi-session mean? ;).

Thanks for anyone who can help.

Paul.

5035. 3M Preformatted Disk Problems

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 16:52:32 UTC
From: raz@MCS.COM
Message-ID: <2u4hgg$b1b@Venus.mcs.com>
Source record: 184847
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a problem with disks and I know I have seen some response related to this so here goes:

I have a 1040ST at home and a 486 at the office. The computer at the office has a much faster modem, so I download the ST programs from the Unix computer I link up to. I then unarchive (ZIP, LZH, ZOO, ARC, etc.) the programs and copy them onto an IBM formatted disk. I am starting to have problems with a few of my disks. Suddenly, *every* time the disk has to be accessed, the machine gives me a warning "Disk retry fail - If it is a hard drive, check connections. Floppy, then insert disk, etc." If I take out the disk and then put it back, making sure I get a definite click on the internal ST drive, then the machine is able to read the disk....until the next time the disk is accessed.

Questions:

1. I am using 3M preformatted disks. I am pretty sure I formatted them on the IBM anyway, but not positive. Is this having an effect ? I have heard that preformatted disks have serial #s of 0, is this a problem?

I used Norton Disk editor at work and I compared an MSDOS formatted disk to a disk I formatted with ps2form (from Diskutils in atari.archive). Here are the differences:

PS2FORM (on ST) MSDOS 5.0 (on IBM)

OEM ID IBM.. MSDOS5.0
Extended Boot Record
Signature 00 Hex 29 Hex
Serial # 0 173938138
LABEL .....1.... NO NAME
System ID (weird chars) FAT 12

These are the differences between the two Boot Records. Should I change the Serial # to a large number? Does the ST have problems with seeing two disks with the same serial # in sequence ? How does this cause my problem?

Eventually, the drive can no longer access the disks. Should I get unformatted disks ? Is ps2form a good program to format disks for the ST and IBM ? Or, should I just format them at the office?

Help!!!

Message-ID: <KUCIK.1.2E05CDA6@ft1.zlin.vutbr.cz>
Source record: 184775

Hi all!

I have problem with MultiTOS. In a program I make an appl_init call to init GEM. Then I do something like pause(), sleep(10), Psigpause(..), Pkill(0,SIGSTOP). You may see that I wanna suspend the process. But GEM responds in very mysterious way - it hangs up a while like if I called wind_update(BEG_UPDATE) without successive END_UPDATE call: I can't access menus, windows gadgets etc, but everything runs alright. After a given pause time counts down or signal arrives, everything gets ok again. If I move my mouse while start-up this thing doesn't happen! Any clue? (I use MiNT 1.04, AES 4. 0, MiNTlibs pl44, PureC)

5040. Mouse recommendations for ST

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 19:19:13 UTC
From: jd@flash.jpl.nasa.gov
Message-ID: <JD.94Jun20121913@flash.jpl.nasa.gov>
Source record: 184959

I have a Mega ST and had trouble with the Atari mouse because it's
motion was not very accurate or smooth. I bought an SQuick mouse but
the ball get's hung up inside sometimes and I have to shake it down.
It too is not brilliant.

I need something fairly accurate, editing 32nd notes with a fincky
mouse is not recommended if you wanna keep your sanity.

Anyone have recommendations on a good solid accurate tracking well
make me happy again mouse??

Thanks in advance

5041. **YES!!** (Speedo 5.0)

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 19:20:12 UTC
From: error@blade.stack.urc.tue.nl
Message-ID: <2u4q5c$40o@tuegate.tue.nl>
Source record: 184960

Yes!

The latest issue of ACN news has a full page advertisement for Speedo 5.0!!! I had been dreaming of a modular Speedo that could rescale any sort of font. It exists, well almost, the new Speedo 5.0 is able to use Speedo, Type 1 (postscript) and Truetype fonts. This is really too good to be true. Okay, the upgrade is as much as my original Speedo 4.1, but it is worth it when I look at all the free fonts available.
I'm not sure anymore I want free fonts, because on the same page they offer 2 speedo packages with 100 fonts each. I won't name the price, since I don't want to be advertising for Compo or anyone else for that matter.

This might be the reason Compo was holding off the sale of SPeedo 4.2, because it saves them the trouble of having to offer extra upgrade paths to people that bought the upgrade to 4.2 very recently.

I hope to hear compatibility reports and such very soon ;-)

Erlend.

In article 27515@bradford.ac.uk, P.A.Booth@bradford.ac.uk (Paul Booth) writes:
>
>Is it possible to use one of these like a personal CD player?

Most all come with a software utility to allow them to play audio CD's.
You would need one written for an Atari, of course. I'm sure they are
available.

>I.e. does it run of batteries?

I'm pretty sure the Apple PowerCD can run off batteries as well as AC.

>How would you get one working on an ST? Is it feasible?

You need a CD driver for an ST. And while there are not a bunch of titles
just yet for Ataris, it's still feasible for some shareware collections on
CD. It's a lot more feasible for Falcons due to their better graphics/sounds.

>Erm, is it multi-session? (and what exactly does multi-session mean? ;).

Yes, the Apple PowerCD is multi-session. All that really means is that
it can read 'multi-session' CDs, such as Kodak Photo CD's. Apple made a
big deal out of the PowerCD unit as it can hook up to a Mac, TV or stereo.
I don't know how good it is as computer CD reader, however. I imagine it
is a double-speed unit but I seem to recall the ergonomics of the unit
being rated poorly. It's $199 out of MacWarehouse.

Even so, you would probably be better off buying a unit from a supplier
who has it set up specifically for an Atari. Less worries that way.

5044. current MiNT/Minix versions?

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 20:15:25 UTC
From: mhsmith@ornews.intel.com
Message-ID: <2u4tde$ql0@ornews.intel.com>
Source record: 184964

Could someone please tell me the current MiNT version and the current Minix version? I have seen a 1.5 upgrade for Minix but elsewhere I've seen version 6.09 binaries.

I just installed MiNT/Minix this weekend on my Mega STe. I'm having SOME difficulties getting the rc and profile files straight. I'm actually able to log in, but as it turns out with my id with a uid of 100, I have more permissions than when I log in as root! Something's terribly messed up... guess I'm not as Unix literate as I thought I was.

Can someone recommend a GOOD document that will go into a little more detail about setting this environment up?

Also.. have I read incorrectly, or is TOSWin supposed to load GEM and TOS programs to allow GEM to multitask. The version I have doesn't do that so well, but does load the .ttp files without crashing.

Thanks for any input,

Michael

> Lots' of stuff about pre-formatted MS-DOS disks...

Yes!! Pre-formatted MS-DOS disks on an Atari ST will cause problems
because of the serial numbers that seem to be the same. I bought a pack of pre
formatted MS-DOS disks once (because they only had those and they cost the same
as the usual un-fomratted disks), and checked the serial numbers- which were all
the same!
There are utility programs that change the serial numbers of disks without erasing any
data on them.
Look up in the usual FTP sites and look under "utilities" or "disk" or something.
I **think** one of them is called "Uneekit" or something.

Well, I don't know about fitting them in an STe but here are some reprsentative
prices, again from APS Technologies. Pays to shop around, though.

160Mb $269
202Mb $269
240Mb $309
324Mb $499
500Mb $649

LaCie (a Quantum company) is advertising a 2.5" 85Mb drive for $199.

It seems the Mega 4 I recently purchased had the internal floppy drive just about dead.

Any way when I began loading programs I would get drive A not responding. So I opened up the unit to se if there were any loose connections which would cause thes problems.

The floppy now wont do anything and I now have a desktop which has no disk icons. I need to know where a reliable and reasonably priced repair facility for the Mega computer is. (Note this should be in the United States).

The South Eastern portion of the country would be preferred, but the UPS shipping charges will not differ by much regardless of where the unit goes.

5056. For Sale: Lots of Atari ST hardware and software

Newsgroup: comp.sys.atari.st
Date: 1994-06-20 23:23:37 UTC
From: dtarico@OCF.Berkeley.EDU
Message-ID: <2u58dp$77p@agate.berkeley.edu>
Source record: 184975

Hello there. I have a complete Atari Mega ST system with software and accessories to sell. The prices listed are not necesarily firm, but are are my guesses as to the fair value of the items (not including shipping, if necessary). I am also open to REASONABLE offers and package discounts. If you are at all interested in anything or if you have any questions, please contact me (email or phone) and we'll talk. Of course, I'd like to sell most of the items in packages as much as possible. I will also give preference to local buyers (San Francisco Bay area). Thanks for reading!

<< HARDWARE >>

Mega ST: 4 meg RAM, TOS 1.4, Overscan installed, supports 1.4 meg floppy drives, internal floppy drive is shielded for use with Spectre GCR. Excellent condition with keyboard, mouse, joystick, and original box and manuals.
$350

Tweety Board: Provides 3-channel "stereo" sound on all ST computers.
$10

AT-Speed C16: Hardware IBM PC emulator, has 16 MHz 80286 processor and 80287 math coprocessor, mounts directly on CPU of 520/1040/Mega ST. With appropriate adaptor, it can also fit in the Mega expansion slot. I don't know if a STE adaptor is available. Runs as a program or a desk accessory. Supports many video modes, including 16 color CGA ,and monochrome EGA and VGA. Even runs Windows 3.1.
$175

Spectre GCR: Macintosh emulator for all ST/STE's and TT. Includes genuine Apple 128k ROMs, Spectre 3.0 software, Mac System 6.0.5, a Macintosh reference manual, and Epstart printer driver which allows printing on Epson-compatible dot matrix printers.
$225

Atari SM124 monochrome monitor: Very sharp picture.
$70

Atari SC1224 color monitor: This is the nice JVC-built one with the controls on the front.
$120

Monitor Master switchbox: Allows both monitors to be connected simultaneously, switch between them by pushing a button.
$10

External Hard Disk/Floppy Disk system: This in an excellent unit! It contains a Maxtor 200 Mb 3.5" SCSI hard disk, ICD AdSCSI controller, and a TEAC 3.5" 1.4 Mb floppy drive. These are all mounted in a nice looking, sturdy metal shoebox-style case with power supply and a good-size fan to keep everything cool.
$400

TOS 1.2: 2-chip set.
$10

Turbo Blitz cable and software: If you have 2 floppy drives, this allows you to backup copy-protected disks (or any other disks). It works VERY fast because it writes the backup disk at the same time that it is reading the source disk.
$10

Time Source battery-backed up clock for 520/1040 ST: Mounts under the keyboard chip (plugs in, no soldering). Last time I used it, it worked fine except that it would occasionally lose the time if the computer was not used for a while.
$5

A-B switchbox for modems or printers. It has female DB-25 connectors, good quality construction in a nice metal case. I also have a cable with male DB-25 connectors at both ends if you need it.
$10 (switchbox), $13 (switchbox, cable)

Epson EX-800 dot matrix printer with color kit: Can print black and white or color. It is fast: 300 cps draft, 50 cps NLQ, and bi-directional printing for everything including graphics and NLQ. Has both serial and parallel interfaces. Has an expansion slot for adding other interfaces, larger print buffers, etc. Low usage since new print head was installed. Includes manual, several black ribbons and a color ribbon. Can also include a parallel cable, a stand, and paper if desired.
$140

<< SOFTWARE >>
(* indicates that I don't have any printed documentation. A few of those have some documentation on the disks. The list format is:
Title, Version (if any), Vendor, Price: Description)

Productivity:

DynaCADD, 1.4, Ditek International, $90: Professional-quality 2D/3D CAD program. 640x400 minimum monitor resolution, 1 Mb minimum RAM, supports math coprocessor, can work with AutoCAD files, fully registered and upgradeable.
Word Writer ST, 2.0, Timeworks, $10: Word processor.
Data Manager ST, 1.1, Timeworks, $10: Database.
SwiftCalc ST, 2.0, Timeworks, $10: Spreadsheet with graphics.
Publishing Partner, Soft Logic, $15: Desktop publishing software. Mono and color versions. Includes extra fonts.
*MichTron BBS, 1.8, MichTron, $5: Electronic bulitten board host software
Financial Cookbook, Electronic Arts, $3: Financial planning.

HabaCom, 1.06, Haba, $3: Telecommunications, terminal emulator.
*Flash, 1.6, Antic, $5: Telecommunications, terminal emulator.
*Kermit & Remote Control accessory for Flash, Antic, $3: Adds the kermit file transfer protocol and remote access capabilities to Flash.
STalker/STeno, 2.06/1.04, Strata, $10: Terminal emulator and text editor respectively. They work together and can also be used separately.
*Degas Elite, 1.1, Batteries Included, $5: Painting, drawing.
Easy Draw, 2.26, Migraph, $20: Nice Vector-based (object oriented) graphics drawing with page-layout capabilities.
Supercharger, 1.02, Migraph, $5: Allows bit-mapped images to be imported and edited/manipulated for use with Easy Draw.

Programming:

*BASIC, Atari, $3: The BASIC that was distributed with some ST's.
DevPac ST, 0.91, Hisoft, $3: 68000 assembler.
Personal Pascal, 1.11, Optimized Systems, $10: Integrated Pascal development environment and compiler.

Utilities:

PC-Ditto, 3.01, Avant Garde, $20: Allows the ST to emulate an IBM PC. Slow, but works well. Runs on all 68000-based ST/STEs. Includes MS-DOS 3.3.
NeoDesk 3, 3.01, Gribnif, $15: Provides a greatly ehnanced desktop with many extra features and capabilities.
Cleanup ST, 4.18, ICD, $10: Hard disk data repair and recovery utilities.
Diamond Back II, 2.42, Oregon Research, $15: Excellent hard disk backup utility.
*Encrypt, 2.0, Stone Age, $5: File and data encryption.
*Supra Hard Disk Utilities, 4.04, Supra, $3: Formatting, partitioning, etc. Usually supplied with Supra hard drives.
*Calendar, 1.0, MichTron, $4: Appointment and reminder calendar accessory.
Micro C-Shell, 2.61, Beckmeyer, $5: Unix-like command shell.

Games:

*Moon Patrol, Atari, $5.
Death Sword, Epyx, $5.
*Arctic Fox, Electronic Arts, $5.
*Dungeon Master, FTL, $5.
Star Trek: The Rebel Universe, Simon & Schuster, $8.
*ST Protector, Paradox, $4.
*World Games, Epyx, $5.
The Pawn, Rainbird, $5.
*Transylvania, Polarware, $4.
*BattleZone, Atari, $5.
*GoldRunner, MicroDeal, $5.

>A TT gets under 0.6 MFLOPS. The Medusa rates 3.13 times faster for math
>operations. Therefore, the Medusa should only be about 1.9 MFLOPS.
>

That is not correct warwick, The NEss Benchmark always gives 3.13 as a
comparitivte value, ST, TT or any other atari sytem. The rating you should
be comparing it to is 0.93 which is 1780%, the value offered by NBM on a
TT was 3.83 which is 430%

Real time application test have shown that the Medusa is about 4-6 times
faster, to understand how NBM works you need to read the NBM docs first!

>(this is one problem with comp.sys.atari.announce - no follow-ups)

Well, I personally like the Atari mice, and have never found them to be inaccurate or rough. There are at least two different models of Atari mice, and I strongly prefer the newer ones (round ball door, metal around the plug, nylon rollers on the bars, made in Japan). I have a couple of suggestions for you:

1. Adjust your mouse acceleration, if any. Poor mouse acceleration can make things erratic. You can choose from linear or proportional mouse acceleration. I suggest you try Mouse Doubler 2 from atari.archive.umich.edu. It does linear acceleration in the following way. In low res, nothing happens. In medium res, vertical movement is doubled. In high res, both axis are doubled. What ends up happening is that the mouse moves a constant amount no matter what resolution you are in. Also, it has a feature which you might like a lot. If you hold down ALT, it halves everything, so the mouse can be moved very precisely (thought not very fast). I find this very handy when doing very detailed work with drawing programs and such.

Proportional mouse acceleration can be OK (the one built into NVDI, for example), or it can be really horrible. Basically, the faster you go, the farther the pointer goes. So, you can literally "throw" your mouse pointer around when the acceleration is set to be high (which I find increadibly irritating, as I always overshoot stuff when I get in a hurry).

2. Get a track ball. Some folks swear by them (not me, but I also like Atari mice). There is a company that advertises in Current Notes that will sell you an Atari CX-80 track ball converted for mouse use. I seem to remember that these were built very stoutly. You can even pay extra and get a billiard ball instead of a plain trackball. You can also specify exactly where you want the buttons and such. They are:

MTS Creations
P.O. Box 56762
Chicago, IL 60656
1-312-763-1822

There is at least one other trackball made for the ST out there. Also, any Amiga mice/trackballs can be converted to Atari use by switching two wires. On Amiga mice, you don't even have to cut or solder anything (the wires are on little plugs that you can move around easily).

Hope that helps.

The difference between "awful" and awful is often very small... Take Douglas Adams, for example; the guy has created such cookings (e.g. Hitchhiker's...) that one can only wonder. Fantastic mess! But when someone with less talent tries the same: some sci-fi, some fantasy, some crazy jokes: very often the result is just silly... But I just got some horrible images in front of my eyes: there are lots of potentially _very_ dangerous Virtual Reality talking areas in Internet...! Sadomasochistic sex-areas especially might become some kind of a problem.. ;-) ?

> Tommi, thanks for sharing your views and comments. My last post sounded a bit
> self-serving and indeed, overly-defensive. I apologize for that as it wasn't my
> intent. My suggestion to all who want to see more games specifically for the
> Falcon is to BUY the games you do find and to write to the developers/publishers
> encouraging their support.

Yes - I've tried myself to encourage Silmarils by buying Ishar 2 for Falcon.. ;-). I'd do that again; good game. What, however, makes me worried, is this: it's so unbeliavably easy for software houses to "forget" Atari - and }}especially Falcon. There are so few of us, after all.. Maybe success would activate both game-makers and us, Atari users. But before things get better, there's a heavy barrier of certain "apathy" to climb over. In my own "neighbourhood" many people have Falcons (about 10..) - and most of them still wait for those promised Tornado, etc. Falcon-games, asking all the time: "WHEN can we buy them..??". I'd hate to disappoint them (and myself) telling them the most probable "truth" in a moment: that those games most likely will never come out. The moment they'd believe that - they'd not ask for those games anymore. They'd surrender in a way: "so - then we'll have to be without good new games. Sad, but one can't help it..."

Back to apathy. That's why such feelings have to be kept far away; people have to believe in Atari, which means buying new machines, new programs - not standing in a corner, waiting what'll happen... There's some feeling of that "standing" all around; even in German Atari market. People just wait for something to happen - and meanwhile soft- and hardware producers think: "Oh, now they don't buy anymore... Should we support them anymore?"
That way may lead to a disaster; people quietly lift their hands up, one by one. And when Atari, finally, is on its feet again, and that long awaited Falcon-060 ;-) comes out with 32 bit graphics, etc... There are no Atari users left. No software. Nothing. That's a very real vision - but fortunately also

one we may be able to avoid. By acting, buying, talking about new things..

It all may depend on pretty little things; when there are over 100.000 Falcons around, some famous game house _may_ decide to test the market with some new Falcon game. Then the wheel _might_ start turning... Other firms just might follow that example, and try themselves. So, in the end, we might have a rather healthy Falcon game-situation in a relatively short time. But as long as nobody seems to take the first step.... We're in trouble. I'm a bit sad about Dino Dini not (obviously) wanting to even consider Atari/Falcon-support. He seems to very strongly believe this "games for Falcon" -idea is totally mad; not worth one thought. If those other developers share that feeling, as I'm afraid, they very well may... Then whatever people write to them, even in masses, asking for games, will never be taken seriously. I'm afraid that this scene has already been decided for us: people behind money (and games..) have simply decided that Atari _is_ dead - and if it isn't... Well, it should be - and anyway, who cares..? Well, WE do - but they don't know it. So, we'll have to tell them more loudly what we want - and that we exist.

It's _really_ a pity we can't contact game-makers (most of them) via InterNet... I wouldn't probably be the only one who'd have something to say to them ;-) ! Maybe it's their luck. An army of angry Atarians might be a problem for them...

> For those who want to know the facts about where Atari is heading, obtain a
> copy of their last stockholders' report. You'll find it, er, enlightening.

That's some good news, if anything =-) !

In the mean time: let's buy tons of Silmarils' great games - and by that way show them we're worth supporting!

P.S: I believe "Sim City" could be patched to work in TT and Falcon 16 color GEM modes 640x480, etc... I just haven't found that query inside the code that checks the resolution ST-Low, and refuses to work, if that isn't correct. Can anybody more skillful (or luckier ;-) find a solution? That game would be great in e.g. 800x600x16 ! (like in Macintosh)

" A man without a woman is like a fish without a bicycle.. "

(Allan Von Sandwich, 1833)

If you understood that - then there's some reason to feel worried ;-) !

g: Tommi.

Rising Star computers specializes in floppies and memory. They are at
1-800-252-2787. Toad does repairs (I have not tried them) at 1-800-448-TOAD.
D&P Computers also specialize in Atari hardware stuff at 1-800-535-4290.

I have personally found the Toad hardware guy to be a bit rude, but he has
not done any actual work for me so I cannot comment on his competence.
D&P made my first hard drive, and given that the ownership has not changed,
would be my first choice if I were to have hardware problems. Rising Star
once sent me a real dog of a color monitor refurb, but they did promptly
return my money with no hassles. It is possible that the monitor was damaged
in shipping (I bought a used unit from the net afterward, so I never did
end up with anything from Rising Star). They struck me as nice guys, and
I would not hesitate to try them again.

I just commented on this in the Gauntlet II thread, but briefly I suggest
that you send a copy of DC MaxTracks along with your computer, and ask that
the new or repaired drive be tested to see how far it can reliably format
(82, 83, 84 track). See my other post for details.

I see posts from ICD all the time on GEnie. Their bulletin may be old (though I though I have seen newer ones than that, maybe a GEbnire error?) but they have more recent files in the library, (and the host software is update all that often--who wants to be DL a new version every month?).

The latest version of the host software is in the lib. and is fairly recent.

>version if it works on your STE and the original doesn't.

This is untrue, I have seen 3 different drives fitted to STE's, one does 84
tracts, the Sonny drive does 82 Tracts..

I have never ever seen a game that used more than 81 tracts, and that was very
old stuff...

The main problem with Games is the protection, very drive dependant, one of
the problem ones is Rob Northern, will work on one machine but not on another,
and it only uses 80 tracks..

The reason the STE was not support, is it did not offer much more than a ST,also
you would need 2 versions of the game, not very practicle...

>magazines often wrongly insulted it.

Did they,,! I don't think so, what will all the OS problems the Res problems the
DMA problem, Sound problems, it should have been recalled...

A lot of new feature were added to version 6.x.x, like you can boot
from 'D' drive...

Also skip booting with just the Alt key, plus many othere features,
Falcon Support...

Plus you should allways update old Software.....

Are ICD closing down...??

Well there is NO SUPPORT on GEnie and from message here there BBS is down..

From some of the resent messages posted on there RTC on GEnie,
people are taking them to Court..!!!

This sort of behaviour is reminiscence of a company with
big financial problems and soon to close its doors...

They don't answer the phone or e-mail or faxes and there BBS is down..!!!

So can some one that realy knows, Please put us right..

And if they do know, can they tell ICD to pull its finger out, and Support
Atari, GEnie and there BBS, (with V32bis Modems)....

And Please post a statement to these facts good or bad...!!

Fed up user...!!

Don't worry Chris -- you're not the only one! I've only ever managed to see
anything in a SIRDS by focussing _in front_ of the picture (i.e. by _crossing_
my eyes), but then the virtual image is inside-out! There's a program available
for X11 which allows you to choose whether you wait to cross or `uncross' your
eyes to see the 3D image (xpgs, I think). Perhaps this could be ported?

Cheers,

For a number of years now, I've been using a Golden Image optical mouse: no balls to get stuck! I don't know if this particular one is still available, but I've seen a number out there (albeit in the UK: I imagine you must be able to find one Stateside too). Summary: recommend an optical mouse.

Cheers,

5075. 1040STe for sale... <sniffle>

Newsgroup: comp.sys.atari.st
Date: 1994-06-21 08:45:02 UTC
From: lfoul@terapin.com
Message-ID: <lfoul.5bet@terapin.com>
Source record: 184998

For Sale:

Atari 1040STe (1 meg, TOS 1.63, & internal DS drive)
Two SC1224 monitors (One works just fine, the other quite old & dead)
Atari SF-314 double-sided drive
I.B. 5-1/4" single-sided drive
Panasonic KP-1080i printer (needs a ribbon)
Supra 2400/Fax modem w/RS232 cable
Atari Megafile 30 (32 meg HD, no bad sectors)
Loads of software (Prospero C, WordPerfect, PC-Ditto, many games, etc.)

Everything is in fantastic shape, and works beautifully.
I really don't WANT to sell this, but I've got no place to put
it except for my closet. <sigh> The STe can be upgraded to
4 megs of RAM simply by pulling out the old 256k simms, and
replacing them with 1x8 or 1x9 one meg simms.
Asking $375 OBO. Please e-mail replies, thanks.

Jake

Is there a PD / Shareware version of Mosaic (world wide web) browser / Hypermedia available for the ST

I'm hoping to go on line later this year and I would like information regarding whether such software is available and if I will need to run a Unix version on my ST or if I dial into a Unix-support site if the ST version will interface correctly.

e-mail replies are preferred - thanks for the help !

Chris

Hello guys,
Could someone please email (and post?) me some address of a
dealer in Europe (pref. in The Netherlands) who sells Elite
and/or Elite II for the Atari ST? A friend of mine looks for
such a dealer, but I don`t know who sells this stuff in The
Netherlands (not very interested in games), so any address
(possibly the software company themselves??) would be welcome.
ThanX in advance.

GreetZ,
Hans Staalman

Hi Danny

The MAUS-Net is a BB-System that is NOT online with the internet!
Mails into the MAUS-Net are possible but nothing else. You have to ring up the mailbox an then download the programm.

If it is possible I will upload the programms to an ftp-site.

Give me some days of time, please!

I second that, the GI optical mouse is really lovely. Been using mine for 5 years now and wouldn't go back to a mechanical one if you paid me. Well, if you paid me _that_ much I might...
With Silk Mouse 3.2 for resolution independent movement, the mouse is very smooth and very accurate, never needs cleaning, what more could you ask for?

> for only $379. That's a good deal, people. Heck, I bought a 340Mb drive

Ouch.. I paid $400 for my LPS240 not a year ago.. The Quantums seem to be dead nuts reliable after toasting Seagates, Miniscribes, Tandons, Maxtors... Say, I've either had really bad luck or I'm real hard on drives :-)

Thanks for the tip though, I'm putting together a large commercial BBS system and that 1G drive sounds like just the ticket.

>make me happy again mouse??

I've been using my LogiMouse for 4 years now. Works perfectly, nice shape, excellent micro-switches (good mouse-click-feeling:)

Recently I've seen some of them in a near department store (in Germany) and I was quite surprised to see the name Atari printed on the package. These ones have 2 buttons, not 3 like all the PC stuff. I don't know whether LogiMice were ever sold in the US.

>If it is possible I will upload the programms to an ftp-site.

But do ask Martin Osieka for permission to do so. I'm sure he'd be very disappointed if you didn't. The readme file of WINX BETA explicitly tells not to upload the file anywhere else!

After all, it's a BETA version. Some new features work only on TOS versions >2 (for example choosing your own (Speedo)GDOS-font for window gadgets). Maybe he tries to implement them for the older TOSes, too.

>to be true.

Yes, that's very nice.

However, there are rumors on MausNet (especially in newsgroup atari.text) that there will be another Speedo/TrueType Scaler out during the next 8 weeks. It is said to be _a lot_ faster than SpeedoGDOS (I suppose it's written or at least optimized in Assembler). Also, drivers for colour printers may be available then.

As I said, it's just rumor. But the one who spread it, was Ulli Ramps, one of the developers of the Papyrus word processor. He also said that the people who do this interesting programme have found some bugs in the original Speedo scalers from Bitstream :).

Source record: 184915

Hello,

I just recently bought a used Supercharger. I received everything
necessary with it except the instructions. I can get the unit to work
fine running off of floppies but not the hard drive. When I run the install
disks it tells me files are missing but are in fact in the current directory.
I believe the original disks to be OK but just don't know what sequence
things need to be done in. If any one out there can photocopy the docs I
can pay you, send you floppies, or trade you some misc stuff for the docs.
Please E-mail me if you can help.

> Anyone know what the update for Connect 2.46 does?

It fixed a bug in the zmodem download. Under some cirumstances Connect
sent an recover request with an random fileposition to the host so that
the first part of the file got lost.

> Is the update needed for the English version?

Yes - even though English language is supposed to contain less random it
is needed ;-)

> a.a has the german and the english versions of the prog, but only a
> german version of the updates. Sorry, I still have to learn German.

Just copy the update files over your english version and connect will
try to stay in english mode. (Replacing connect.prg and connect.asc
will not change the language)

: very good with other types of optical illusions, but I simply can't see
: anything in these images. I stare, I let my focus drift out, but I
: can't see anything. Not that I feel inadequate, but still... ;-)

There's an article on SIRDSs and related techniques in the july issue
of the German c't computer magazine. There, it is said that "10-15%
of all people cannot perceive the 3D effect at all for unkown reasons."
Personally, I speculate that some people who can't see the 3D objects
in SIRDS may not be able to see them because they have not learned to
use the horizontal disparation for deriving information about the
position of points in 3D space. This may not become apparent in everyday
life, as there are many other sources of 3D information.

Regarding SIRDS software, there is a Borland Pascal program accompanying
said c't article. I am uncertain about the copyright policies of the c't
folks, but technically, it may be fairly easy and painless to port this
stuff to Pure Pascal.

<GRIN>. Annius wrote me an email saying that he didn't want to blatently
plug his editor (hence the brevity above), and I greatly respect that
attitude. I did take a peek at Edith, but I still prefer Tempus2 for my needs
(it is still the speed king, upon the systems that it works on). I encourage
others to look at the Edith demo on atari.archive.umich.edu (and to scarf
up a used copy of Tempus2 if one becomes available).

5099. [Newbie] : PC Program to read ST1040 FD's?

Newsgroup: comp.sys.atari.st
Date: 1994-06-21 16:24:33 UTC
From: spiff@spiff.demon.co.uk
Message-ID: <772215873snz@spiff.demon.co.uk>
Source record: 184920

Hi,

Does anyone know of a program that allows an MS-DOS based PC to read
from / write to Atari ST 1040 formatted 3.5" disks? I'm particularly
interested in transferring ASCII text files between an ST and a PC.

Alternatively, a program for the ST that allows it to read from
/ write to an MS-DOS (v3 or above) formatted disk would be fine.

Thanks for your help,

:Spiff

I have used disks formatted with ps2form on all kinds of different machines,
and they have never failed me. I'm not sure if it does a random serial
number, but my guess is that it does (as I have not had problems, even
when using a bunch of ps2form disks sequentially on PC, ST, Mac, Sun, etc.).
So, my suggestion would be to format a bunch of disks with ps2form and
use them for your file transfers. I have a batch of disks for which I
foolishly used permanent labels (which are now totally inaccurate), so they
now have MSDOS written on them in big red letters, and are my "transfer"
disks :-). I formatted them with ps2form, and have been using them for a
long time now.

I have just bought MultiTOS and the documentation is very sparce to
say the least. Does anyone know where there are any info files or FAQ's
on MultiTOS on the NET?

Also how do I get UISIII to work with MultiTOS?

I have some TOS prorgrams which when run (even in MiniWin) hide the Mouse
pointer, although they do not turn the mouse off, is there any way of
'unhiding' the pointer again?

>wouldn't have to spend any time on it but would receive presumably some either
>payment for the source OR a royalty based payment. Now I can envisage a lot of
>legal and other problem's here but what is your feelings about this ?

It's standard procedure... some conversions of GOAL! have been handled by
third parties... PC and SNES. The problem is no publisher would give an
advance to cover the cost for the Jaguar, because of it's low potential
sales. My estimate above would not be enough to cover 25% of the cost of
a conversion.

>Of course even if all the problem's etc could be surmounted I guess the biggest
>one would be finding someone to take any of this on ...

Yes, they would have to do it for about 3000 pounds to make it worth while
for me, and I am not prepared to move outside the professional domain, for
what should be obvious reasons...

ArRrRgGhH!!!!

Down here in Oz we have some pretty good deals on hardware, but 2.5" IDEs are expensive! One firm wanted AUS$900 or thereabouts for a 240mb! (That's about US$700 ...

Still, getting a PC on Friday, with:
8 meg RAM
420 meg HD
486DX2-66 (VLB Ports)
1 Meg Cirrus Logic Video Card (exp to 2 meg)
1.44 floppy
Minitower Case
Honeywell Keyboard (Nicest I've seen)
Soundblaster 16 bit
Panasonic CD ROM
and all the ususal junk (Dos 6.2, Windoze 3.11, mouse, etc)

For AUS$3200 ... (US$2300)

And it goes a crap load faster than those Macintoshes .... So Ner Ner Sinclap
...
;^)

I have had recent dealings with ICD. They have a STUPID
voice-mail system that is the only way to reach them unless you
happen to know the extension of the person you want to reach! A
little patience and attention to the dumb voice will eventually
get you to a real person! In the case of most of us that will be
Howard Peters. He is only available from 10-2 cst mon and Wed. If
call at some other time you will be disappointed to find out that
there is no one to talk to you about Atari tech problems.
I had to return an ADSCSI ST+ host adapter that had gone
south, probably from a static jolt. I got it back in a timely
manner, or rather I got a new one to replace it for $50.00 to
cover repairs and shipping. I have always found them reliable and
friendly to deal with.

>Any help, is appreciated.

True, there is only the updated German program file. However, the
resource file is not included in the archive. This is so you can use
whatever language resource file you were previously using. Just
replace the program file and use your old .RSC file and you should be
fine.

I have a MichTron EP 16/512 eprom burner. This is the better of the two
burners that MichTron made. This is the one that plugs into the cartridge
port on the side of the ST. It is very fast and works well. I do not have a
need for it anymore. Best offer takes it.
I do not read this base often, so please reply in Email..

I can confirm that it works on a TT also. In ST-Low, and you have
to hold down the `compatibility buttons' (Alt-Control as it runs).

Neat game.

>-Hutch- @ Fair Dinkum Tech

John, I had to send this suff opened, my e-mails
to you just came back, you have a fault with your from address..

From: hutch@ilmen.a5-ilmen (John Hutchinson)

Hi John,

Yes Please could you give ICD a poke,
If they don't intend to support us on GEnie and from
what Mickey Boyd has stated, no reply
to his e-mails no BBS and no phone calls...

People need to know what there current version is,
and they do need to know if they need to Upgrade,
that is one thing that ICD have never stated...

There Bulletin does not give version onfo on there
CleanUp util, or a file with that info...

There BBS uses old PEP type modems, this gives
only 2400 with V32bis modems...

From some of the messages on there RTC, some people
are taking them to court, this does not look to good
for a once respected USA company...

I have good dealing with them in the past, but not in the last few months..

So Please John see if you can help....

See you soon....

Bye the way what was wrong with your PC clone...:-)

The latest Acorn with the ARM 610 is causing a lot of interest as it has 2
CPU's, it can run 486 stuff, there are used here in a lot of schools and in the

UK in a Big way, the ARM 610 (risc) is faster than the fastes 486 machine,
a Amiga dealer here is going to use them as a Amiga replacment..

I think they are worth a look, I did have a play some time back with a A5000 very impressed...

From memory AT&T are involved with Acorn/Olivetti...

My latest machine is a Mega ST2, I like the design, fitted with a ICD Micro host, Quantum 240 meg drive, Auto Overscan and ICD ADspeed and using NVDI...

NEXT ONE copy, of e-mail....

Hi John,

If you can find out what is going on with ICD,
can you get a statement posted to these facts,
were things are going and what are there problems...

Just to put peoples mind at rest....

Thanks.....

DOS does quite a good job actually! Just format a floppy on the PC as
720K and off you go - the ST format is near identical to the PC and an ST
will happily read/write to a PC floppy.

While it's certainly not 'all' of them, you can send a message to the IAAD (Independent Association of Atari Developers) via the Internet link to GEnie. Although active membership is down from past years, they are still quite active and include both US and European developers. A _thoughtfully_ written letter expressing your concerns and yes, even suggestions, would be welcome. You can send it to the IAAD in care of the President, Dorothy Brumleve, at dabrumleve@genie.geis.com

Cheers,

5125. Atari & C-LAB GmbH agreement

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 13:52:39 UTC
From: hutch@ilmen.a5-ilmen
Message-ID: <1994Jun22.135239.6802@boojum.lanl.gov>
Source record: 184943

Here's a note from James Grunke, Director of Atari Music and AUdio that some of you might find of interest:

==========
Last Friday (June 17) at the Atari annual stockholders meeting, Sam Tramiel announced that Atari is licensing Falcon030 technology to C-LAB GmbH of Germany in order to have continued development of a pro-audio/music multimedia workstation. We are confident that the proprietary Falcon030 technology can be competitively developed with dedicated hardware and software to support the growing needs of pro-audio, broadcast, and multimedia production. C-LAB GmbH has extensive experience in developing and marketing multimedia software and pro-audio hardware. Product details and specifications will be released at a later date.

Atari will continue to manufacture and support the Falcon030 in its current configurations as the market demands. Atari is considering further computer products based on the Jaguar chip set, the worlds first and only 64-bit interactive multimedia home entertainment system.

Thank you for your support.

James Grunke Director, Atari Music and Audio

==========

Anything from Atari HQ that mentions the Falcon in a good light is welcome!

5126. Atari Financial Report

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 14:02:35 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <1994Jun22.140235.7072@boojum.lanl.gov>
Source record: 184944

As promised, here are some quotes from the latest financial report from Atari? They should be of particular interest to anyone still trying to hang on and develop new products for the ST/TT/Falcon computers. Judge for yourself...

About the Falcon030:

"Since introduction in the first quarter of 1993, the Company has shipped small quantities of this product. The company does not expect sales of this product to be material in the future."

About their other computers:

"The Company also has some inventory of its older 16-bit computer products and 8-bit game products, namely ST and TT series of computers, 2600 and 7800 video games systems and XE computer and Portfolio products. As a result of these inventories being technologically obsolete and noncompetitive, the company has written off these inventories. The Company is expecting minimal sales from these products in the future."

About the Jaguar:

"Sales of the Jaguar product line began in the fourth quarter of 1993 with approximately 17,000 console units shipped which, along with software sales, resulted in $3.8 million of Jaguar product sales in the quarter." ...
"Sales of the Jaguar and related software products constituted approximately 46% of the company's net sales in the fourth quarter of 1993."

The report goes on to detail how Atari has closed all offices worldwide, except for the Netherlands and Sunnyvale, and reduced its workforce from 570 employees to 133.

Notice that they don't even give the number of Falcons sold although they did quote numbers for Jaguar sales, which is quite a departure from Atari's usual modus operandi.

Note that since the Jaguar comprised 46% of Atari's net sales, that does NOT mean that the Falcon made up the other 54%. They've been dumping old inventory like it was a garage sale and have sold properties and other holdings, as well, giving 'corporate downsizing' a whole new meaning. Let's hope it works!

Thanks go to Charles 'Mad Dog' Johnson of the CodeHeads for this info.

5127. Re: 3M Preformatted Disk Problems

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 14:17:11 UTC
From: hutch@ilmen.a5-ilmen
Message-ID: <1994Jun22.141711.7485@boojum.lanl.gov>
Source record: 184945
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

This thread reminds me of a humorous incident dating back to my old 8-bit days (ah... now those were the days!):

I've always purchased and used generic diskettes, both 5.25 and 3.5, finding that I could obtain huge cost savings by buying them in bulk (my favorite source being MEI Micro). After just receiving a large shipment for distribution to my Atari user group, I was in the process of formatting a bunch of them for that month's PD disk-o-the-month. A rather snooty member was giving me a hard time for buying those 'junk' diskettes, saying that the extra money for quality disks was well worth it, even claiming they were faster (yeh, we know that's a load of crock but you had to know this guy). Anyway, to prove his point, he opened up a brand new box of Maxell Gold Label 5.25 disks which at that time were probably the most expensive available, about $2.00 each or so, as I recall. Anyway, out of the box of 10, 4 of them would NOT format at all.

heeheeheeheehee... did I ever enjoy _that_ one! :)

Yeh, the cost per Mb tends to get less as the drives get bigger. But then again, it ain't no bargain if you can't scratch up the extra $200. ;-)

>That's almost double the storage for about a third more. Now, what to do
>with 1.8 GB .... :<)

For my Atari software, that would be more than sufficient by a long shot. However, for Mac and Windoze software (especially Windoze!), I could fill up that 1.8Gb space fairly quickly!

Amazing how drive prices have come down recently. Of course the very best time of the year for any of YOU to buy a drive is immediately AFTER I buy my next one. From my past experience, you should be assured that the price for the same unit will be cut by 50% as soon as my check clears. :)

But I'm going to need a larger drive soon. Anyone here interested in a very nice 3.5", 1/3 height, Maxtor 340Mb SCSI drive? Send me an offer if anyone is interested. I could also FILL it with PD & Shareware Mac software.

5129. Gemini and Mupfel: more questions

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 14:37:38 UTC
From: i2020123@ws.rz.tu-bs.de
Message-ID: <1994Jun22.143738.27218@ibr.cs.tu-bs.de>
Source record: 184949

Hi!

Thanks to Hendrik, Waldi and Frank.

I wrote a short program which can be used to start the mupfel from the
desktop with the option `+G', allowing the mupfel to call GEM-Applications.

```
#include <process.h>

main()
{
int ret_code;

exec("mupfel.ttp", "+G", "", &ret_code);
return ret_code;
}
```

Conversion of slashes into backslashes is possible by typing `set -S'. There
are some more shell flags. Does anyone know what they mean? You only
get a short list when typing `help set'.

Here are some more questions concerning the mupfel:

- Is it possible to save the screen before starting an applikation?
- Can the cursor flashing be switched off?
- When entering a wrong command, it should be possible to enter the correct
command while mupfel is still searching. Can I prevent mupfel from resetting
the keyboard buffer after `command not found'?
- Is there any documentation available via anonymous ftp?

Greetings from Braunschweig!

Ruediger

Karl -- Not a bad price for all that, given you are buying it in Oz.
Of course, we won't tell you what you could buy it for in the US. :)
Does Oz Customs still slap that terrifically huge tariff on computer
hardware purchased from overseas?

Hope you are happy with the PC. Yours is almost identical to the one I
recently sold. After a year of struggling with win.ini, autoexec.bat,
config.sys and the usual nightmarish configuration problems everytime I
wanted to change something or add a new component, I gave up on it and
figured their just HAD to be a better way. My solution was to get one of
those "slow" Macintoshes you refer to (which still lets me run DOS &
Windows, albeit more slowly). The Mac uses a very unusual technique...
you turn it on and it works. What will they think of next, eh? ;-)
BTW, not a bad review/comparison of Pentium vs PowerMac in the latest
Windows magazine. Somewhat slighted to Intel, of course, but not bad.

Still, I consider the Atari to be the easiest machine to use of the lot.
Would that they would come out with a _factory_ (no Medusa, please!) 040
or PPC-powered unit with all the goodies for under a grand, plus a new
dealer network to sell & support them. Then we WOULD see new software!

Hey, one can still dream, eh? Hmmm... wait, I think there is a provision
in 'President' Hillary's health care plan against that for us yanks. :)

Sounds familier. A friend used to buy Verbatim 5.25 inch disks at 25GBP a box of 10 - this was in 1982 - a lot of cash. I used to buy unbranded ones at 0.5GBP each. He was really amazed to hear I rarely got a bad disk - maybe 1 in 50. He assumed 1-2 out of a box of 10 would be bad - that was his success rate with pricey disks.

|> For AUS$3200 ... (US$2300)
Given in as well eh Karl? I just got a PC - not as beefy as yours.
486SX33
4Mb RAM
250Mb HD
Soundblaster Pro
Tapestreamer
1Mb 1024x768 video card/accelerator with multisync monitor
minitower
DOS6.2 WIndows4Workgroups, Microsoft publisher, a shitload of multimedia stuff including Encarta, Cinemania and 4 others, Microsoft Works and more manuals than you can wave a stick at. Cost 250GBP more than my basic no frills Falcon did ie 1250GBP.
I filled the HD in a week as PC windows stuff is so bloated - 80Mb for a C compiler??? 25Mb for a WP???
The Falcon still gets pride of place :-)

5135. MiNT on Macintosh???

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 15:40:50 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <2u9m22$gjl@charm.magnus.acs.ohio-state.edu>
Source record: 184852

Hi all,

I hear rumor that someone has written MiNT for the Macintosh. I can't really imagine why anyone would bother with this, but, it it is true, I would be very much interested in where to get MiNT for the Mac from.

Also, I'm interested in MiNT for my ST (of course); could someone please explain (in words that someone who knows UNIX only on the most casual of levels could understand) the following things;

1) What will it do for me?
2) How do I install it?
3) What is the latest version and what FTP sites have it?
4) Does it come with instructions that someone unfamiliar with UNIX can understand?

Please e-mail responses to me directly in addition to posting them since I frequently do no have time to read this group.

Thanks for any information you can give me!

5139. Let 'em Fly Revision II Announcement

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 19:36:00 UTC
From: st4w1@rosie.uh.edu
Message-ID: <22JUN199414362579@rosie.uh.edu>
Source record: 184856

LATE BREAKING NEWS!

Ken hollis, developer of Let 'em Fly Revision II (LTMF-2)
has just added a new twist to Let 'em Fly II: Extended
Object Type fixing! That's right, EObTs!

What does this mean to the programmer? Better functionality,
a better looking resource file, and more programability for
your objects.

What does this mean for the USER? It means a better user-
interface, easier to use design, and a nicer looking program!

How do you get this information? You get Let 'em Fly II!
Let 'em Fly II has one drawback. The only way you can ACCESS
this information is if you get the developers' kit for LTMF-2
and you actually program for it! The calls are EXTREMELY
easy to use and understand, and they can be easily added on
to your pre-existing program.

The new AES functions are just one of MANY functions of LTMF-2's
extended and enhanced AES calls. Since LTMF was such a boom when
it first took off, this version of LTMF-2 will also be available
for free, and the developers' kit will not be sold! That's right,
the kit WILL NOT BE SOLD!

Anyone who wishes to get more information regarding LTMF-2's
enhanced calls and any updates in the making should write to
the following address:

khollis@bitsink.gbdata.com.

Anyone who answers this message by pressing "R" or "r" will be
** FLAMED!!!!!! **. This is a shared account where I'm at, and
it's not wise to write here. Write to the mail account ONLY!
Any messages written to this account (st4w1) will be ignored!

This is a first call for anyone who wants the developers' kit
or information about it. Since LTMF-2 will not be made
available until late July to early August, I am announcing
this NOW so you out there can get familiar with LTMF-2's new
calls.

Thanks in advance.
-- Ken Hollis

5142. Mouse-Ka-Mania II

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 21:50:20 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2uabms$gc0@mailer.fsu.edu>
Source record: 184768

This file has been on atari.archive for awhile, but I just got a chance to look at it. I have not seen any comments about it, so I thought I would mention something....

This is cool stuff! It allows you to replace any of the standard 8 system mouse pointers with other static shapes, or nifty animated ones. For example, the "busy bee" can now flap its wings. There are a bunch of static and animated pointers included, and you can also create your own with the included editor. This is a desk accessory, but you also have the ability to create a stand-alone auto folder program that installs the mouse pointers of your choice at bootup (this is good, as the first Mouse Ka Mania did not have this, and the acc was not well liked by some of my other applications). The latter method also reduces memory usage significantly.

Mouse Ka Mania II is shareware ($15), not hamstrung in any way, and a 1994 Codehead production.

5143. Button Fixer

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 21:55:55 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <2uac1b$gc0@mailer.fsu.edu>
Source record: 184765

The Button Fixer acc is now available from atari.archive.umich.edu. It was written by Charles Johnson (of Codehead fame), and it fixes the incredibly annoying "single click produces a double click" bug in all TOS versions >= 1.4. The acc is tiny (390 bytes) and works as advertised. It's sooooo nice to have reliable scrollbars again!!! It is in Utilities/Tosfixes.

5145. RAMDISK needed

Newsgroup: comp.sys.atari.st
Date: 1994-06-22 22:03:27 UTC
From: hallvart@ifi.uio.no
Message-ID: <2uacff$3v9@yrsa.ifi.uio.no>
Source record: 184859

I've been using "Rambaby.ACC" for a long time, but after a LOT of work got loset because the
machine locked up and I had to reset the machine I got fed up, so I tried using MAXIdisk.PRG
instead, which is reset survivable!!! GREAT!!! I like it a lot, except for one thing- the disk compression. It takes time to compress files, and I'm using some other file systems with the computer too, so compressing them might be another weak link in the system.

So, my question is: is there a reset survivable RAMdisk WITHOUT data compression available?

Thanks.

Hallvard, Oslo, Norway

5146. Atari 520ST w/monitor $100 + shipping !!

I thought C-Lab was defunct. I think Emagic (Ensoniq?) bought the rights
to Notator from C-Lab, and C-lab just died out. I guess I was wrong, or
they re-formed to do a new project.

Since ST drives are 100 percent MS-DOS compatible, you should have no
trouble at all transferring text files from one system to the other. But
it does have to be in the 720K format for most ST's.

CEO file contents:
Hi,

AFAIK the official version is that CBM has gone bankrupt. This however has no effect on Commodore UK, Germany or Canada for whom "business is as usual" even though stocks are getting low. So Commodore is not _really_ dead... yet!

What appears to be at stake is Amiga's chipset and technology, not the company itself? Whether Samsung, Sony or HP buys it or not, the question is will the Amiga be continued as a computer range or will the technology be cannibalized and used in TVs or other products ?

It seems now that Atari is on it's own now as an alternative to Microsoft/IBM/Apple stuff. But for how long ?

All this is AFAIK and picked out from c.s.amiga.advocacy so I might even be completely wrong. So no flames please...

Bye,
Nick.

*** GIF'S ***

Hi, I am after a few GIF's for my Atari, I have never
bothered to collect them, but I would like a Few of the
Breath taking type, like... scenic ones, space, pinups/nudes (not porno)
cars, ships, animals etc..

About say 10 in all that are worth keeping...

So were can I get them and what are the file names...??

What is the better Viewer, Photocrome or Gemview, Speed of Light
was not as good as Photocrome to me that is...

Thanks....

I'm looking for a PD game called Software Projects. I've read about it
in ST Format (I guess). It is a strategy game in wich we manage a software
house and try to keep it running.

Please e-mail any answers to SIM01@ciuc2.uc.pt.

Thank you!

5163. Modem: Dial with no carrier!

Newsgroup: comp.sys.atari.st
Date: 1994-06-23 13:21:00 UTC
From: stein.arne.jensen@p10.secom.ct.se
Message-ID: <2e099cae@p10.secom.ct.se>
Source record: 184625

I believe it must be possible to send dial strings through a modem without a carrier, but I just can't figure out how (in Gfa basic from a Falcon).

Why do I need it?

To write a program to enable me to code and send adverts via the phone to a commercial norwegian TV station. Normally this would be done manually by pressing 2-digit codes for each letter you want in the advert. I'm able to do by sending the tone-signals through the monitor speaker, but think that using the modem would be a much more elegant way of doing it.

Here's what I want to do:
- Dial the phone number to the TV station (that part is no problem)
- monitor through the phone and wait for an answer (that would be okay to if the modem didn't hang up while I was waiting - actually - here's where the problems start).
- Send the page number by modem (3 digits - f.ex. "356").
- wait for a new message from the TV station.
- Send the whole advert - a maximum of 240 characters or 2-digit codes.
- Tell the modem to hang up when all is done.

It seems to me that the tricky part is to keep the modem from hanging up when it don't detects a carrier.

I'm using a Best Electronics 14.4/14.4 faxmodem

>a thing about...!!!!

I'm sure your point is taken, Roger, but spreading rumors that ICD is going bankrupt and/or killing off all support for Atari ain't exactly 'Fair Dinkum' either. They are very much alive & very much a part of the Atari community.

Their telephone support hours are limited and perhaps due to the time zone difference you missed them when you called. I don't know about their BBS and can't speak about what versions of software they have posted where. Have you sent them email? Their GEnie address is ICDINC and you need to speak with Tom to get the straight information. I'm sure he will contact you.

Like you said...

>1040STE and a Falcon.
>
>But of course, since you're so famous you must be right and we should always
>regard your word as the ultimate and unquestionable truth... right?

Oh, come now, Patrick. This is very childish of you and quite inappropriate.

If you would take the time to read _all_ my posts in this thread, you would realize that I've already said I cannot divulge the actual number of Falcons manufactured to date because of a promise I made to a certain individual at Atari whom I would like to remain friends with. You are correct that I have no proof that I am willing to offer. As such, I don't expect everyone to accept what I say at face value and you are certainly free to believe in whatever fairy tale strikes your fancy. The numbers being bantered about are such HUGE exagerations that I felt I simply had to comment on them.

My original angst was directed at some European magazines that have been spreading all kinds of half-truths and false information, apparently in an effort to boost their market. If choose to believe otherwise, that's fine.

I have also _already_ apologised for my self-serving tone where it looked like I was patting myself on the back. That was not my intent. I only wished to emphasize that as a developer, IAAD member, and looooong time Atarian, I might have access to certain facts that others are not privy to. If you feel the need to tear me down even further after I have already apologised for the misinterpretation of my posts, then that's YOUR problem, not mine.

I'm sorry you felt the need to be so hateful as it was uncalled for, IMHO.
It certainly encourages me to develop more for the Atari. Yeh, right.

GFA BASIC for the Atari is still the most popular (and the most capable, IMHO) BASIC language for the ST. While the company itself has shown little interest in any further development of the product, it is supported by a very large user base. GFA is easy to use, fast, and capable of most any programming task.

HiSoft BASIC is another to look for. While not as widely used as GFA, at least the company is still actively supporting Atari. I prefer GFA, but that's me.

Of course, there are LOTS of other choices besides BASIC, but if that's what you want to use, these are your best options.

Cheers,

About the Falcon030:
etc., etc.
About their other computers:
etc., etc.

Sam Tramiel bascially told us Atari had dropped their line of computers six months ago in an article in the San Francisco Chronicle talking about the Jaguar. I'm holding on to my STe because it still does what I need. I even turned down an offer of $800 for my entire system! Look at it this way . . . no matter what computer you go out and buy, it's pretty well obsolete in a couple of years, anyway. If Atari doesn't get its act together and put out out some new games for the Jaguar, I see trouble ahead. . . . Mark van Wyk

All of those funky PC mpeg players require DOS because they use stupid
memory tricks (ex, compiled with djgpp's DOS extender). I use OS/2 at
work.

I have an ST; I'm not even going to _think_ about playing an MPEG on
this hardware.

I'd like to get some netters' opinions on Atari. Have they always been full of shit, or what? They have always been technologically advanced (the 800 more than the original ST) but they are the worst managed company in computers!

Now, don't get me wrong, I love my 1040ST. What other mid-eighties computer is still a useful and viable computing tool? XT? AT? Early Mac? NO! But, Atari badly fumbled with the "one case fits all" approach. They had the first computer that cost under $1/kbyte and they still fumbled the ball.

My first computer was the Commodore Vic-20 and I rapidly outgrew that. Instead of buying a C-64 like everybody else, I bought an Atari 800xl. It was the most advanced computer with everything built in. Unlike Apple, you didn't need to add boards to actually do anything. And C-64s always seemed anemic to me.

So, I got the 1040ST in ~1986 and I used it for WP, Programming, Communications, and, yes, games. I bought the 1040ST instead of an IBM-compatible because, again I thought it was the best value for the money, even though the Amiga took over the role of successor to the Atari 800 (proprietary chips, distributed processing, etc). I still use it and the cost and size of software is *very* refreshing. At work, I regularly use word processors and graphics packages which approach and exceed 20 meg disk space!! And Word Perfect 6.0 for windows is supposed to use over 60 with everything installed!!!

This is not a *flame* at Atari users, but at the inept management at Atari. They seem to think that *we* let them down, but, in truth, it is they. I fear that the Falcon, which is an *awesome* machine on paper, will also suffer from their (the Tramiels') shortsightedness.

Have they ever left a company in better shape than when they found it???

Until they demonstrate good management, I will never buy another new Atari. I will still continue to search out for used values from other disgruntled owners, but *never* again will I fall for their slick pitches. I hope that the Jaguar is good enough to overcome their incompetence. I hope, I hope...

zpy@glue.umd.edu (Zhiping You) :

>Can anybody tell me where I can find a basic compilor for my Atari ST ?
>Thanks in advance.

In case of GFA BASIC v 2 you can use the Mnilu compiler. It's not
the official compiler but it works ,and it's free! Should be
avaliable from a.a.u.e.

5178. QWK off line readers

Newsgroup: comp.sys.atari.st
Date: 1994-06-23 17:29:58 UTC
From: jabrana@powertech.no
Message-ID: <1994Jun23.172958.30390@powertech.no>
Source record: 184892

Are there any good QWK off line reader programs avaliable for
the ST. I'm so fed-up with Captains- and MT- QWK programs.
They work but there has to be programs which are better.

I have heard about a few other programs such as IMHO and the
Red Wine Reader. Where are they avaliable from ,which ftp site
(which directory & what is the file name) ??

If you know more about it the please reply by e-mail NOW .. .
Thanks in advance.

5179. CD-ROM Music player

Newsgroup: comp.sys.atari.st
Date: 1994-06-23 18:03:26 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <2ucipe$gbs@darkstar.UCSC.EDU>
Source record: 184897

This is cool...I'm sitting here, using the 'net, listening to Enigma on my shiny new triple-speed NEC CD-ROM with my Falcon. But I had to hook the drive directly out to my stereo system (i.e. my Falcon gets no sound). I remember hearing mention of a desk accesory or something (a la DeskTRacker) that will play songs from the CD-drive (hooked up via SCSI) through the Falcon's sound system. That would save a lot of wire-swapping. Could anybody tell me where I could find it? TIA!

5180. GFA Basic on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1994-06-23 18:07:36 UTC
From: sccoe@ucscb.UCSC.EDU
Message-ID: <2ucj18$gd5@darkstar.UCSC.EDU>
Source record: 184896

I was wondering about the level of support GFA Basic has for the Falcon?
I mean, can it use Falcon resolutions and such.
Also wondering if there are any routines/modules easily available that will handle loading pictures of different formats (GIF/JPEG) and playing digitized sounds (yes, I am a STOS junkie....)
cya & tia!

Hello,

This problem with STraight Fax might sound simple, but I just am stuck. I am trying to import a file from PageStream, using the given export module from ST Fax in PageStream. I get an EPS file, and from there, I don't know how to load it into ST Fax to get it going.

Thanks,

Joseph

>Atari still maintains that 8MB on a Falcon030 is not possible. However,
>the fact that you CAN have 8MB of 32 bit wide RAM (you can buy 8MB 72-
>pin SIMMs and one of the Falcon SIMM upgrade boards that allow the use
>of single 72-pin SIMMs) has me almost convinced that it HAS to be
>possible SOMEHOW (via a SIMMFIX-type program like the STE had to allow
>2.5MB). If I had the money right now, I'd try it out.

Sigh - how often will this come back?

Facts:

* The Falcon's memory controller chip can only handle ONE bank of memory.
* 72-pin SIMMs may contain ONE or TWO banks. The latter is the case
for 2, 8, and 32 MB types.

Conclusion:

Plug an 8 MB 72-pin SIMM into a Falcon w/SIMM-carrying expansion board,
and you'll get 4 MB, since the Falcon won't see the second bank (and won't
even try, because it hasn't got the hardware to do so).

Got it?

bye, Peter

Yeh, I understand daddy-Jack almost blew a gasket over that comment. Even though it's true, for all intents and purposes, it still fries my blood.

> If Atari doesn't get its act together and put out out some new games for
> the Jaguar, I see trouble ahead.

Same old, same old. Atari beats everyone to the punch with a technologically sophisticated piece of hardware at 1/2 the price, and blows the marketing. At least Jag owners can take some comfort in that 3DO is sucking wind now.

>than the original ST) but they are the worst managed company in computers!

What was your first clue? :)

>They had the first computer that cost under $1/kbyte and they still
>fumbled the ball.

Remember that issue of Byte magazine with a 1040ST on the cover? Good ol' days.

>I bought the 1040ST instead of an IBM-compatible because, again
>I thought it was the best value for the money [...]

At the time of introduction, the ST _was_ an amazing bargain! None of the other makes could come close to its capabilities at such low cost. The marketing slogan 'Power without the Price' had real meaning back then. Although the ST is still a very capable machine, it simply has not kept up with the competition. And as good as the Falcon 030 is, it's still basically just an enhanced ST. It's a case of too little, too late, IMHO. The Falcon is what the STe _should_ have been when it was introduced.

>Have they ever left a company in better shape than when they found it???

Well, to his credit, Jack Tramiel literally saved CBM (Commodore Business Machines) from bankruptcy back in the early-mid 80's before he bought Atari.

>Until they demonstrate good management, I will never buy another new Atari.

Unless they demonstrate better management, you may never have that option!

>I hope that the Jaguar is good enough to overcome their incompetence.

Oh, it is. The Jag is an amazing piece of silicon. But as I have frequently argued in this forum (much to the chagrin of fanatic fuji flag wavers), a lot of profit from Jag sales does NOT automatically mean Atari would roll over a big chunk of that money into new desktop computer development. They might surprise us, but simple economics dictate otherwise, I would think.

But still... Wouldn't it be nice to see a 100MHz PPC or 68060 powered Atari 'Eagle' someday? Oh, and of course it would be under $500! :)

The last released version of GFA BASIC was 3.6 which included some features
for TT support but alas, no Falcon-specific support has been added and from
the looks of it, never will. GFA has evidently lost interest in the Atari.
There has been scuttlebutt of a new Falcon version but so far, that's all.

You can still use GFA on the Falcon (I use 3.5) but it does require a few
minor workarounds sometimes. Unfortunately, I know of no way to make it
support Falcon resolutions.

Maybe some active GFA users here know differently???

: >
: >--Roger

: I don't thing you have cheched this out, the Version on there is
: 6.4.3 this is old, also no version of CleanUp is given...

Cleanup is not posted to the libraries, it is nor PD nor
sharewhare, and does not have the sort of copy protection a host adapter
offers. 6.4.3 is not the old, and most people will not need a newer
version because the changes are minor and affect only people with certain
hardare. I have checked this out, I am on GEnie often.

: Try e-mailing them on GEnie...??

: And why would people be taking then to court..??

I posted in the ICD section a couple of months ago, and recieved a
reply the next day. The people taking them to court are likely the same
people who post massive messages cursing ICD and their products while
asking for help and demanding a response with an hour.

I'm a little tired of every 12 year old winer posting long rambling
messages about how much they think a company owes them (when they bought
the product second hand and stole have the sofware they run on it).

You need to oad the printer driver (STFAX21.PRT) into PGS just like
you would any printer driver. Set it to print to Parallel (NOT to disk)
and print your file. The file you get (in the PGS folder) will load into
STraight Fax and should send find. (You load it as a FAX file.)

I've done this with no problems. If you have more questions, please ask.

5194. Atari ST hardware *** FOR SALE ***

Newsgroup: comp.sys.atari.st
Date: 1994-06-23 23:54:07 UTC
From: apratt@taligent.com
Message-ID: <CrvJq8.44p@taligent.com>
Source record: 184763

I guess this is a "me too" posting... I see a lot of for-sale ads in this group, and here's another one.

One Mega ST system, with 4MB RAM, 80MB hard disk, SFP004 (floating point) board installed, keyboard & mouse.

One SLM804 laser printer, plus spare toner cartridge.

One 520ST hand-upgraded to 1MB. External floppy drive (DS but not HD).

Two monitors, one color and one monochrome. The mono monitor fades when there isn't enough white in the picture (like a white-on-black text-mode screen with just a shell prompt on it).

All cables, power supplies, etc.

ALSO:

An Epson FX-100 wide-carriage dot-matrix printer. Parallel interface. With cable.

No reasonable offer refused. Will sell the lot or pieces. You pay shipping or come pick it up: I'm in San Mateo, California; I could bring the stuff to work in Cupertino if that's better for you. I'm not looking to make a lot of money on this, just to get rid of it.

You can E-mail me at the address below, or call at (408) 777-5253 (work). I may or may not see a reply to this posting.

Try the immense pictorial archive at wuarchive.wustl.ed, where trial and error will almost certainly guarantee good results. The archive has not been indexed lately, but old picture indices are annotated and describe the pictures and their quality, and you should find pictures to your taste.

: What is the better Viewer, Photocrome or
Gemview, Speed of Light : was not as good as Photocrome to me that is...

GemView is a memory hog, with a clumsy interface, but extremely powerful, and has the sterling ability to configure its display to your system. It is expensive and english documentation is very limited, hence my failure to register it or rely upon it. Speed of Light does a very good job of reducing large GIFS and JPEG's to display their best on an ST/e low-res screen, but the test versions I have tested are buggu, crash often, and the GIF files it writes are often corrupt. Stuart has also disabled his latest "size filtering" feature in his most recent release, and I was not able to test it to my satisfaction. Again, I have not chosen to register it. Photochrome 4.0 does not allow one to display or process at a Mega STE's full speed, and does not do a good job in reducing most pictures to display on the STE's screen without a great deal of distortion. It does do a magnificent job on the pictures that it can display within those limitations.

As you can see, I am dissatisfied with all threse programs (although I offer their hard-working authors honest feedback and a chance to make improvements), and their is still need for more capabilities. There is a rumor that the brilliant Damien M. Jones (of View II Fame) has a world-beater in the works.

Source record: 184762

In a message dated 6-23-94, Hallvard Tangeres asked:

"So, my question is: is there a reset survivable RAMdisk
WITHOUT data compression available?"

I currently use a reset-survivable RAMdisk that came off the disk of one of the rather old "COMPUTE's ST Disk & Magazine" issues. However, I am uncertain whether Compute ever bothered to declare those programs available for free distribution or not, after that mag folded. (BTW, I am using a 4 meg STe with TOS 2.06, so it seems to have been coded well).

Also, I understand CodeRAM, the Codehead's RAMdisk on the Codehead Utilities disk is reset-proof. However, this is part of a commercial package, although you may be able to find someone selling a used original for cheap.

Hi Everyone.

Never thought I'd see the day when I saw this, but here goes. I recently bought a copy of a game for my Falcon, and while it works O.K., I'd like to have one or two things fixed on it, and so I present a challenge :

Could someone write a patch / do a hack of the game so that I can use it in a res larger than 320*200*16 (640*480*16 wanted ...)

Can someone patch the install program so that it responds to returns, etc!?

The game in question, if anyone is interested, is Wonderland by Magnetic Scrolls / Virgin.

Please reply by e-mail,

Best Regards,

Karl.

>So were can I get them and what are the file names...??

The main FTP site I check out for cool GIFs and JPGs (primarily computer-art, but all kinds of pix are there) is at wuarchive.wustl.edu in the /multimedia/images directory. under which there is a gif and jpeg area. There are some INDEXes, but I doubt they're all that up to date. And the newest stuff appears quite often in the unindexed directory under the gif and jpeg areas...

>What is the better Viewer, Photocrome or Gemview, Speed of Light
>was not as good as Photocrome to me that is...

The best display for GIF files is Photochrome *on a stock ST/STe*. The fastest viewer for GIF/JPG (and one or two others) is probably Speed of Light. And the viewer that will let you look at the *most* graphics formats is no doubt Gemview...

If you have a TT/Falcon, then I would aim towards Gemview or SOL (Gemview if you have a truecolor system)...

If you're sticking to GIFs on a stock ST, Photochrome will give ya the best results (but is significantly slower than SOL)...

Na, get a Acorn Risc PC, runs 6 times faster than the 486DX2 66 mhz
when manipulating pics..

You can also Multitask Windows with it, Run 2 OS's together....

Gee what a machine, I think it leaves most PC for dead,
and with 24 bit graphics at 1600 * 1200..

I just recieved the Info from Acorn NZ to-day...

5203. Gauntlet II (Working on STE!)

Newsgroup: comp.sys.atari.st
Date: 1994-06-24 08:07:41 UTC
From: s9104948@yallara.cs.rmit.OZ.AU
Message-ID: <2ue48d$shq@goanna.cs.rmit.oz.au>
Source record: 184774

Hey I got Gauntlet II finally working on my STE (TOS 1.62, 1MB). Took me 4 hours to figure this out. By the way it has nothing to do with my STE not being able to read past track 80, I'm formatting disks out to track 85 without any problems. I originally thought it wouldn't work as I had a later version of TOS but apparently this is incorrect. I cannot explain why the following does work, it just does (-:

For people trying to get Gauntlet II working try this:

- Make a copy of Gauntlet II, using a normal copier. The disk is protected and the copy won't work but that doesn't matter. I used Fastcopy III which I got off Atari ST Review (Issue 9).
- Boot this copy, watch the title screen. Then the screen goes red and LOADING is displayed (well on mine it does!). After this the screen goes dark red, and the drive stops making noises.
- At this point, remove the copy and insert the original. My Gauntlet II now continues loading and actually works though the screen area with the scores/health is slightly corrupted.

Now all I need is a 4 player adaptor, then I can play 4 players!

From: s9104948@yallara.cs.rmit.OZ.AU
Message-ID: <2ue54s$sr6@goanna.cs.rmit.oz.au>
Source record: 184776

Apart from Gauntlet II which came with my STFM the only other game I have which will not run on my STE (Though I managed now to get Gauntlet II running, with a bit of effort) is StarGlider. The difference with this game is I don't actually know how to play it, and aren't exactly that interested in it anyway.

Now that I can play Gauntlet II on my STE (My parents have my STFM) and that I have Frontier I'm very happy.

Last thing: Anyone know where to get a Class 4 Military Drive in Frontier, or a Fighter Launcher? Really need to get hold of a Class 4 Military Drive. I've got nuclear missiles by the way! I've done stacks of assassinations (these I consider boring now!), photograph military installations etc, even destroyed military installations. My combat rating is Competent, Imperial Ranking of Baron. Is there anyone out there with a better imperial rating? I'm really dying to know what you get offered once you reach Viscount!

This program is LAPD licenseware IIRC, and therefore can only be distributed
by LAPD. Hence it hasn't appeared on any FTP sites.

Version 3.6 (TT) does support all Falcon resolutions including true colour,
with the exception of 256 colour mode in which the editor suffers screen
corruption. Falcon specific calls can easily be made through the XBIOS command.
Correctly written programs will work in any Falcon resolution.
The STE DMASOUND commands sometimes don't work correctly, but you can still
use the Falcon DMA by calling the new XBIOS routines.

Hello There!

I am the MIDI and Music specialist for ST Format and I regret to tell you that Quartet is not the package you are hoping for. As yet, the only package that wll be any good for you is Breakthru from Software Technology (Tel: +44 61 236 2515). This package costs £125 UKP approx and does all that you need it to. It will sequence 16-bit replay 16 samples and also combine them with MIDI sequences pretty elegantly.

Hope this helps.

Hi,
I have an old 1040 STf with 1Mb, a friend of mine want to use it to
learn to type...is there any such freeware/shareware?

I have not used the Atari for quite a few years, so have no idea about
any ftp sites and how to download them....at work I have a Mac connected
to ethernet directly, so I can download files there (and write to a DOS
disk format) So I would really appreciate someone to tell me how I can do it.

Thanks,
Apollo

Hi Duncan,

Why not try the TWOINONE archiver ? Despite its name it supports many
different archive standards and all you have to do is add the raw TTP
files n a defined directory. Once set up it is ease itself to use.

>
> Regards Bertil Jagard..

Hi Bertil!

I'm amazed who I keep finding on The Internet...

Re: MagiX

I have reviewed the program for ST Format and found it to be just the
job for anyone who is serious about the ST. Combined with KObold and
Ease it kinda leaves the competition a little deflated.

Ease has its shortcomings but the bulk of it is spot on and very very
nice. Watch for the up coming review!

This could be the real future of desktop environments on the ST.
Neodesk 4 will have to really jaw drop me to change my mind and Geneva
is probably completely eclipsed by MagiX. Shame, but that's the way it
is.

Regards to you,

Andy.

5217. S.J. Mercury-News article 6/24/94

Newsgroup: comp.sys.atari.st
Date: 1994-06-24 14:42:17 UTC
From: L676791@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <16FDF6C6DS86.L676791@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 184786

The following article appeared on page G-1 (front page of Business Section) in the June 24 issue of the San Jose Mercury-News:

ATARI'S JAGUAR IS GOOD FOR MORE THAN GAMES

by Lee Gomes

Think of data processing at federally sponsored research labs, and what usually comes to mind are multimillion-dollar Cray supercomputers and other fearsome integer-chomping datasauruses.

But a $250 Atari video-game player?

That's the platform of choice for some researchers at the Argonne National Laboratory in Argonne, Ill, who are developing a new electronic commerce system for the nation's textile industry.

The project is designed to allow the 130,000 businesses involved in textiles, from yarn makers to fashion houses to retailers, to use the nation's evolving information superhighway to conduct their business.

Since the system must ultimately show people who know little about computers to see fabrics as finished clothes on their computers screens, Argonne engineers are designing an easy-to-use interface that is heavy on the graphics. And since the program needs to run in all kinds of sites, and inexpensive computer was required.

As a result, said Lucian Russell, a lab director, a group of engineers chose an Atari Jaguar for their development work. The Jaguar, which began shipping this year, is a $250 video-game player that uses a number of Atari custom-designed chips for advanced 64-bit graphics effects.

"We're trying to see what the limits are in terms of stuffing things into a small, cheap box," he said. "It may not be robust enough to do what we need, but this is an experiment."

Russel said his lab will be using the computer only to develop a demo program that shows off the general capabilities of an electronic commerce system. It will be up to textile companies, should they like what the lab creates, to complete its develoment, using whatever kind of machines they'd like.

Russel said the work with the Jaguar will be completed in the fall, after which the scientists will presumably go back to their Crays.

5219. Question about using GCC

Newsgroup: comp.sys.atari.st
Date: 1994-06-24 16:30:12 UTC
From: vicb@clark.edu
Message-ID: <2uf1mk$hum@clark.edu>
Source record: 184785

Greetings,

I have been using HSC on my floppy-only system for some time. Next week
I will be adding a hard drive to my system, and I'm trying to decide
whether or not I should get GCC and start using it instead.

-- Is 2 megs enough memory from which to use GCC effectively? My last
project ended up having an executable of about 300K when it was finished.

-- Is GCC really all that much better than HSC? I'm particularly interested
in speed of the executable (e.g. with floating point operations)

-- How much hard drive space does HCC consume?

Thanks in advance for any advice or insight.

Victor Bruhn

Greetings fellow ST users. I am looking for an external DS/DD floppy and a <50 meg hard drive for my 1040ST. If anyone is selling their equipment in *good* condition, please e-mail me.

Thanks,

Anupam Razdan
raz@mcs.com

5223. MiNT Questions!!

Newsgroup: comp.sys.atari.st
Date: 1994-06-24 19:04:38 UTC
From: troyc@bnr.ca
Message-ID: <2ufao6$ih1@bmerha64.bnr.ca>
Source record: 184792

Ok, I have been struggling with MiNT for about 1 month now. I have gotten most of everything working, which includes MiNT-Net. This is set up on a Mega 4 STe with 21 and 25 meg unix partitions, the 21 meg for system stuff and 25 meg for home directories (yes, I have now run out of system partition space when I put emacs & its lisp files on, if you were wondering).

I just have a few questions that I hope some of you MiNT experts can answer:

1. rlogin does not work. Well, I got it to work once. Now whenever I try it all I get is a message that says "<user> login is not permitted on this terminal" or something close, where <user> is root or troyc, whichever I am trying at the time. I have the .rhosts file in my ~troyc directory, but I may have the format wrong. Like I said, this worked once as user troyc rlogin to localhost, but never when user troyc does "rlogin -l root localhost". Anyone with rlogin experience please jump in.

2. Both text editors I have, emacs 18.58? and Jove (new and old versions), run too low of a priorty with init. When I set INIT=tcsh in mint.cnf I have no problems with the editors and priorities, but when I have INIT=init, then I have problems. I am calling this a priority problem since with init I have to wait upwards of 30 seconds for any keystroke to be recognized. Without init, there is no delay at all. This limits my ability to do much (root can use a TOS based micro-emacs since minix allows root access to TOS partitions, but my users cannot). Is there a way to get this running at proper priorities, if that is indeed the problem?

3. As stated before, I have minix partitions on two different units. I have created a symbolic link from the system partition to the users home partition, but I cannot do a mv, which bombs each time saying it can't move across file systems. cp will copy across file systems, but it will not copy directories. Is there any way around this short of using NFS? Will NFS actually solve this problem? I tried to get NFS to work once, but I couldn't. I decided it was not important at the time.

4. The famous FTP problem. I need to get the psetid patch from someone I guess. I thought it was in one of the tar file somewhere along the way and I did it, but I guess not. When using FTP, I get the message: "can't set uid". This sounds like I didn't do the patch, can this possibly come from a missplaced passwd file? I have the anonymous account set up and I get the same problem. Will minixfs incorporate the other fix mentioned, which is to Gusetid or whatever, or will I have to do that myself (grep on the code indicates only two or three places to change, is that right?) ?

5. Has anyone been able to recompile stcron4? I don't like it using syslog nor do I want it in my /etc directory. I would rather it use the directory /var/adm or /var/log or whatever. When I use gcc on the supplied makefile,

I get mucho errors.

Things that I would like, so if you can point me to any of the following:

1. A ps which works like in unix: ps alone shows your processes, ps with flags (this differs from system to system, it seems) to show full listings and all processes. The ps I have either shows only the users processes, or the entire system, depending on how the 's' attribute is set on ps.ttp I would like to see a userid somewhere with the processes. This must be possible, since I tried to kill a process run by root and was not allowed to do so. This goes for top also.

2. A version of gzip which recognizes more extensions than .z I would like to see .gz .tgz at least added, if not to just allow any suffix and let me worry if I am messing up.

3. A telnet and telnetd port for mint+mint-net.

4. A curses based clear command to clear the screen...have I just missed this somewhere?

5. A decent curses based (vt100 or vt52) terminal program, ala ST52. Is there a vt100 driver in termcap? I should check when I get home...

******

6. KAY: Is there any hope for PPP in future releases of MiNT-Net, or maybe an add-on or something? My company has a some kind of security problem with SLIP, and will only allow PPP connections for dialin. (great job, by the way! Got everything up and running in one evening, upgrading from 1.08 even!)

******

If I think of anything else, and my newsserver lets this go through, then believe me, I will post again!

Thanks,

Troy Carpenter

>Does this mean there is still a C-Lab, plus EMAGIC?

What happened was that C-Lab had a software division and a
hardware division. The software guys left and started up
Emagic w/ Ensoniq, so yes, there is a C-Lab AND Emagic.

I'd be interrested in how other players are getting on with starball?
I've just obtained my first decent score 15,324,000 when trying to save the screen to disk I resewt the machine. damned cheesed of, just got the bonus up to x4 x4 and had 3 more balls in reserve. Had played Space Invaders, Eggball, Archanoid-ball, and somehow had annihilated a floating Yak, and was docking at space station 9 and up. Got tired wrists as well now, sigh.. Will have to register this damned program...

From: basil@tweety.cis.upenn.edu
Message-ID: <2ufmv2$j44@netnews.upenn.edu>
Source record: 184799

I have the following ST equipment/software for sale:

1040 STf w/ Tweety Board (Not installed) $130
SC1224 color monitor 120
2400 baud Supra modem. 30
Wico Joystick (top of the line) 25
included Software:
Flash 1.6, Drivers for HP printers, PD disks, Neodesk 3.1, whatever
else I find.

Buy all for $300 plus shipping or buy separately.

Music: Dr T's Tiger Cub $40 Great entry-level graphic sequencer
Hybrid Arts EditTrack II $40 Great professional sequencer
M1 Editor plus 500 sounds $35

Buy all three for $100

Games:
Ultima 5 $30
Ultima 6 $30
Populous $20
Populous/Simcity bundle $30
Populous II (awesome game) $30
Speedball $20
PowerMonger $30
MIDIMaze (Kill a Happy Face) $10
Dungeon Master $12
Chaos Strikes Back $12

Best offer on the above, plus shipping. Or buy with computer for
discount. Most have manuals and original boxes.

Contact Brian Stokes at basil@graphics.cis

5231. FOR SALE 520ST with SF354 and mouse

Announcing a new program from D.A. Brumleve!

MathArt: A Paint Program for Young Mathematicians

The emphasis in MathArt is decidedly upon art. The math angle (pun intended!) takes the form (pun intended!) of geometrical shapes which provide the basis for line designs.

MathArt simulates the "string art" studies many children of the 60's and 70's experienced as a part of geometry class. A basic grid serves as the starting point for complex shapes and designs. Points along the axes of the grid are connected to form lines. When crossing, straight lines in a design may be interpreted by the eye as curves. A surprising variety of designs is possible using the points on a single grid.

As a junior high school student, the author found string art to be a clumsy and frustrating activity. The computer does away with the awkward string and nails and substitutes editing at the click of a mouse, thus encouraging experimentation with the potential of line designs. While the line designs are attractive and interesting without further adornment, the use of vivid color can accentuate certain features and enhance the effect. A paint program is included to allow children to color their designs and save them in an onscreen art gallery. No prior understanding of geometry is required to use the program, and even the smallest of computer users will enjoy exploring the creative potential of the basic structures presented.

The program consists of a Main Screen and three activity screens: the Drawing Screen, the Painting Screen, and the Art Gallery Screen. The child creates a line design on the Drawing Screen, embellishes it with color on the Painting Screen, and displays it with other paintings on the Art Gallery Screen. Each screen offers three possible grids for line art: a four-segment cross, a three-segment cross, and a circle. Up to three line designs of each grid shape may be saved to disk for later editing. An unlimited number of paintings can be saved for repainting or for later viewing in the Art Gallery. Paintings are saved in Degas Elite format.

MathArt, like all commercial kidprgs, is accompanied by an Installation Program which allows the parent or teacher to configure the child's disk to suit his/her needs and interests. This grow-as-you-grow approach allows MathArt to appeal to children throughout a very wide age range. To make learning to use the program a snap, MathArt conforms to the user interface provided in

all commercial kidprgs.

MathArt will run in ST Low on any Atari ST/STe/TT/Falcon030.
Printing requires a printer which accepts an ST screen dump;
nearly all printers are supported. Recommended for ages 3-11;
enjoyed by all!

Shipping on or before July 1, 1994! Scheduled to be debuted at
the MIST AtariFest in Indianapolis on July 23! See you there!

5238. SpeedoGDOS v5.0 Announcement

Newsgroup: comp.sys.atari.st
Date: 1994-06-25 02:41:23 UTC
From: steve-j@teleport.com
Message-ID: <2ug5gj$9l6@elaine.teleport.com>
Source record: 184612

The following announcement was posted on GEnie by Compo U.S.:

Atari ST RoundTable
Category 14, Topic 35
Message 26 Thu Jun 23, 1994
COMPO at 03:16 EDT

==========
SpeedoGDOS v5.0
==========

The next generation

SpeedoGDOS version 5.0 is the product of a close collaboration between Atari Corporation and COMPO Software Corp. The result is an essential tool that will simply revolutionize the way you use your computer, and the materials you create.

SpeedoGDOS 5.0 supports Bitstream Speedo, PostScript Type 1, and TrueType fonts. Simultaneously, transparently.

Bitstream Speedo is a scalable font format that has become the standard on Atari computers. PostScript Type 1 and TrueType are the standard formats on other computer systems. All three formats support scaling fonts to any size, with font hinting and kerning for the best possible display and print quality.

With tens of thousands of PostScript Type 1 and TrueType fonts available, a nearly limitless variety - and quantity - of high quality fonts is now available to you. Virtually any type design, style, or character set is easily obtainable. Foreign language fonts, symbol and notation fonts, exotic styles...

SpeedoGDOS 5.0 also reaches new heights in cross-platform compatibility - with the same font formats used on Ataris, PCs, Macs, and other computer systems, transferring data between computers is easier than ever before.

SpeedoGDOS 5.0 includes printer drivers for most popular printers, and an assortment of brand new drivers, including color drivers for color printers, and drivers for LaserJet 4 and compatible printers at 300 and 600 dpi.

SpeedoGDOS 5.0 includes a new manual and is available in two versions. They vary only in the number of typefaces included.

SpeedoGDOS 5.0 (Complete) includes twenty two Bitstream typefaces and is available for $79.95. It can be purchased from any Atari computer dealer or direct from COMPO Software.

The SpeedoGDOS 5.0 Upgrade includes eight Bitstream typefaces and is available to users of SpeedoGDOS 4.x for $50.00.

Upgrading to SpeedoGDOS 5.0

Users of SpeedoGDOS 4.x may purchase the SpeedoGDOS 5.0 upgrade from COMPO Software. Proof of SpeedoGDOS 4.x ownership is required.

Please forward, with your order, one of the following:

1) One of your SpeedoGDOS master disks, or a photocopy of a master disk.
2) The cover page from your SpeedoGDOS manual, or a photocopy of the cover page.

Pages or photocopies may be faxed to COMPO Software if you wish to order SpeedoGDOS 5.0 by telephone, fax, or email.

If you send an original SpeedoGDOS 4.x master disk, it will be returned with your order.

Please include $3.00 for shipping. California residents please add 8.25% sales tax.

COMPO Software Corp.
104 Esplanade Avenue Suite 121
Pacifica California 94044 USA
Tel: 415-355-0862
Fax: 415-355-0869
GEnie: COMPO

==========

Speedo is a trademark of Bitstream, Inc. PostScript is a trademark of Adobe Systems Incorporated. SpeedoGDOS is a trademark of Atari Corporation. LaserJet is a trademark of Hewlett-Packard Company.

Well when 6.6.0 is claimed to be now out, then 6.4.3 is old...!!!

Also if you read my Post, I did not even mention that CleanUp was on GEnie,
but there is a file called Versions, this does not include the current
version of CleanUp, also a Demo version of CleanUp was included
with the ICD Utils, but not now, so how do people find out the later version..

ICD do state you must use there later versions because of BUG fixes etc, they
never state what Bugs are fixed with the version numbers, only features
that have been added.....

Also ICD do state in there software that GEnie is a support site where you can
dnload the latest ICD Utils, but this is not so...

Other people on here are having similar problems with ICD...

>
> I'm a little tired of every 12 year old winer posting long rambling
>messages about how much they think a company owes them (when they bought
>the product second hand and stole have the sofware they run on it).

Well I am far from 12 years old, but do expect a company to stand by its commitments, and statements.....

I have mailed them some 4 times and a Fax and never recieved a reply...

5241. Re: Postcript-Interpreter for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1994-06-25 06:41:55 UTC
From: timg@ccwf.cc.utexas.edu
Message-ID: <2ugjjj$dup@geraldo.cc.utexas.edu>
Source record: 184613

Hi,

In article <1994Jun24.094434.3011@newsserver.rrzn.uni-hannover.de> you write:

>I am looking for a program, which send a postscript-file to a Atari laser-printer (SML).

You are correct that this requires a full-fledged PostScript
interpreter. There are commercial interpreters, but the only free one is
Ghostscript.

You can't beat the price, but GS does have some drawbacks:

1.) You will definitely need 4M of ram to print to the SLM, and about 3M
of disk space for the fonts.

2.) For high-quality output, you need to buy commercial fonts -- most
of the free ones provided with GS are of low quality.

3.) Support for the SLM is limited. The SLM driver was written by
an Atari user who has since disappeared from the net. It
uses the diablo emulator, and hogs more memory than necessary.
I have also heard complaints that it does not center the page
properly (I don't have an SLM so I can't say anything first-hand).

You can ftp a 68000 version of GS from atari.archive.umich.edu in
Gnustuff/Tos/Ghostscript. Various 68030 versions with/without fpu
support are on lifshitz.ph.utexas.edu in pub/atari/ghostscript.

More information about atari GS, including plans for future versions,
can be obtained from my WWW site:
http://godel.ph.utexas.edu/Members/timg/gs/gs.html.

>Like you said...
>
>"Facts.....!!!!"
>
>-Hutch- @ Fair Dinkum Tech
>

Well the Facts are they don't reply, I have sent now 4 e-mail and a Fax
no responce, and there lack of support on GEnie, I go in what I see,
and otheres here have had the same problem....

I stated ARE they closing down, not that they have closed down, but there
actions are not that good, dismall I would say....

Facts are Facts..!!!

I did ask you to post some Real facts about ICD and there lack of Support on
GEnie, so far nothing.....

You can use ST compilers on the Falcon - the only problem is you might
not be able to use some of the falcon specific stuff supported by the
falcon avare compilers.

I think the only way to achieve this is to convert the PS file to an IMG bit
image file using ghostscript. You can print the IMG file with most graphics
programs.

yes, but you really need a hard disk don't you? I mean, since it has to call up all the different .TTP programs..
Is there any ONE program with everything contained available (like DC-xtract), except that DC extract seems too be too old to deal with some of the zip and lzh files. It just stops working and you lose the mouse pointer.

SA> Tel: (+47) 3274 1473 Fax: (+47) 3274 1700
SA> Internet: stein_arne_jensen@p10.secom.ct.se

If your modem supports VERY long dial-strings, you could make a program that sets up very long dial-strings with pauses (commas).. Ofcourse you will have to try out exactly how long pause you should have.. An example dial may look something like this "atdt tv station number,,,,,,,,,,356,,,,1234345656768678989098O etc" and when its finished with all the modem wont receive any carrier, so after doing this it will just say "NO CARRIER"... Unfortunately, most modems just support dial-string of up to 32 characters, and THAT'S not enough.. So its sound much more simply to use the speaker (or why not make a cable to your phone that goes directly from the sound output to the cables in the phones, so you wont have problems with lousy speakers and such?)...

Hope it will help a little..

/Samuel

I'm not sure if the old Flash 1.x version will do what you are asking for.
However, the new Flash II definitely will. It's got a "swap backspace and
delete" option designed just for situations like yours.

If you have any other questions, please ask here or in email.

5272. Lots of Atari ST HardWare for Sale!! Please Read This!!

Newsgroup: comp.sys.atari.st
Date: 1994-06-26 05:41:06 UTC
From: bensmith@teleport.com
Message-ID: <2uj4di$r8l@kelly.teleport.com>
Source record: 184646
Cross-posted to: pdx.forsale,or.forsale,pnw.forsale,comp.sys.atari.st

I have the Following ST Item's for Sale. All listings are Multiple with a number (x) proceeding showing number of each Item.

(3x) ATARI 520STM Computer upgraded to 1 MegaByte of RAM, with RF Port for Output to TV(B&W or Color), Monitor Port, Remaining standard Ports, Mouse & a Working Repairable Power Supply. NO BUILT-IN FLOPPY: $75.

(2x) ATARI SF314 DSDD Floppy Drive with Cable and a Working Repairable Power Supply: $75.

(3x) ATARI SM124 MonoChrome Monitor: $75.

BTW, my 520STM and an external DSDD SF314 Drive can be better than a 1040STF. It's been upgraded to 1 MEG, and both the External Floppy and the 520STM have External Power Supplies, when once blown, at best you open it up and replace the fuse, at worst, since it's External, you replace it. It's this way with Both the 520STM Power Supply and the SF314 Disk Drive Power Supply. And if either the Disk Drive or the Computer goes, you replace the Drive or the Computer. It's Modular. It's been upgraded to one MEG and unlike the 1040STF. It has a Built-in RF Modulator with an RCA Jack so you can plug it in to a TV. B&W or Color. And you can have BOTH for $150 plus Shipping and COD Costs.

Let me know.

First Come, First Served. If your interested in any of this call Ben at (503)256-9974 24HRs or E-Mail me on the Internet at this address: bensmith@teleport.com

I believe there is at least one typing tutor program on
atari.archive.umich.edu. Ftp to the site, grab the top level 0index file,
and have a look. Also, I can highly recommend Mavis Beacon Teaches Typing.
It is an old commercial package (made for a bunch of different architectures,
including the Atari ST in the past). You might be able to find a copy of
this program used or from a computer store (probably in the "bargain bin").
Try Toad computers (1-800-448-TOAD), D&P (1-800-535-4290), and B&C Computer
Visions (408-986-9960). Also, you might want to post a "wanted" notice in
this group.

MBTT is a really nice program. It shows a picture of the keyboard with
"ghost hands" overlaid to show proper hand positioning. There are numerous
drills and such, and at least one "game" to make the learning interesting.
It works on both mono and color monitors. It is a full typing course, well
thought out and implemented.

<nostalgia mode on>

I personally learned how to touch-type with an Atari 8-bit program called
(I think) Mastertype. I remember the speed drill/game with the spaceship
in the middle of the screen, and "bad guys" coming in from the corners.
One had to type the string above a "bad guy" to destroy it. Nifty program!
Anyone remember it?

<nostalgia mode off>

> I have not used the Atari for quite a few years, so have no idea about
> any ftp sites and how to download them....at work I have a Mac connected
> to ethernet directly, so I can download files there (and write to a DOS
> disk format) So I would really appreciate someone to tell me how I can do it.

Well, you get the files to the Mac (how to do this depends on how you are
connected to the Internet, and what types of machines and programs are
available, so consult your local system staff) and write them to a standard
MSDOS formatted 720k DSDD 3.5" floppy disk. If you want to produce such
disks on your ST, grab the program ps2form from atari.archive.umich.edu.
Also, you probably want starter.tos, which contains a bunch of archive
programs in a self extracting archive (to get you started).

I have a 1040STe and I remember when they came out, everyone was talking about the analog joystick ports and how cool they would be, with both input and output. Later, I seem to recall hearing that Atari scratched plans to make these analog sticks. I am wondering: did Atari (or anyone) ever turn out analog sticks? Is there any software that will take advantage of them? If not, how about any technical info on how I can wire up external electronics to them?

Well, not quite - you do get an Archimedes as well, it's just that it can run
PC software as well if you buy the second processor, mind you - so can the ST
with the right add-on board (OK so not quite as fast as the RISC PC but then,
it's not as expensive either so ...)

5287. NVDI 3.0 announced!

Newsgroup: comp.sys.atari.st
Date: 1994-06-26 16:19:00 UTC
From: Hendrik_Mylius@pb2.maus.de
Message-ID: <199406261819.a8217@pb2.maus.de>
Source record: 184677

Hey *!

A couple of days ago NVDI *3.0* was annunced in the MausNet. This new version
gives you full support for *Speedo* _and_ *TrueType* fonts.

ST/TT/Falcon versions will be available at the beginning of August, other versions e. g. for graphics-boards a little later.

All _registered_ users will get Snail-Mail information when NVDI 3.0 is available.

Upgradefees: (ST/TT/Falcon-version!)
- NVDI 2.5 -> NVDI 3.0 : 50 DM
- NVDI 2.1x -> NVDI 3.0 : 70 DM
- NVDI 2.0x and older -> NVDI 3.0 : 80 DM
(Upgrade includes 8 vectorfonts)

Please do your own currency conversion.

/Hendrik/

> not copy directories. Is there any way around this short of using NFS?

Are you trying to copy directories or files ? (I'm talking with experience of UNIX systems here - I gave up on MiNT a while ago - maybe some other time) On the Suns at work mv wont work with directories but mv <dir_name>/* <target_dir> works fine. As for cp, cp -r does a recursive copy, ie. goes down the directory structure.

Hope this helps (if it even works on MiNT :-))

Chris Gentry <cgentry@delphi.com> :
>Was or will TOS 5.0 for the Falcon released?

What do you wan't to see in the new TOS? I suppose the latest
TOS versions are very useable. New versions will now start
to become more memory hungry ,not a problem if you have a lot
of memory but still .. .

TOS 5.xx ,with built in MTOS is something I won't like at
all .. .

IBM has an _incredible_ voice recognition system for OS/2; I saw it
demoed a while ago at a multimedia show. OS/2 has other advantages over
DOS (ie, it works properly) even though the RAM necessary to run it is a
bit larger (8M vs. 640k).

MGIF (monochrome GIF viewer) is an incredibly fast (for an ST) JPEG
viewer that displays greyscales by flickering through several dithered
screens.

GEM-view can load/display JPEGs as well.

> out some new games for the Jaguar, I see trouble ahead. . . .

A computer is only "obsolete" when its no longer useful to you; for some people, this is when you can't buy anymore hardware for it (the ST's been like that for at least 6 years it seems), or when you can't buy anymore software for it (the ST's been like that for about 2 years unless you go mailorder... almost no stores still stock Atari software).

For _you_, your ST still isn't obsolete. Mine is certainly getting there though... Not enough RAM and speed for what I want to be doing (ray tracing, C++ development). Still good enough for playing Ultima V and NetHack though. And Gobliiins...

PCs have been "obsolete" in a technical sense for about 8 years or so... no other computer designed since about 1984 has had sound capabilities as an option that you have to add later, for example. From a hardware/software add-on standpoint, the PC will live for probably 10-20 years more...

> in advance....

At this point, it would be pretty pointless to become a new Atari
ST/TT/Falcon developer; it'd make much more sense to develop games for
the Jaguar console.

If you register GEMview I think it can handle more formats...
ANd on PC several program (even WP5.1) reads IMG files and can
save in other formats...

5297. Hard/Software for sale!

NEW:
3.5" SCSI case subsystem
External SCSI ID
SCSI passthrough
built in fan
Nice vertical case with stand
Very compact and suitable for Atari or Mac needs

Bought it to sell a 3.5" drive I owned... sold the drive loose
so now I do not need the case! Used for about one hour. Original
packing and warranty.

ONLY $75
SRP- $99

Used for review:

The Patrician- manage a trading empire on the high seas
in the 14th century. Trade between Germany,
England, Russa Norway and Sweden. Sweep the seas
of pirates and become the Patrician over all!
Hey, if you are interested I will EMAIL you the
review I wrote for Atari Explorer Online.

Legends Of Valour- Well, if you can't have DOOM! on your Atari,
this smooth scrolling fantasy role playing game
will carry you through! Multiple missions, full
character interaction and enough versatility to
keep you interested.

Books for sale:

The Guide to Calamus Desktop Publishing- A must for all Calamus 1.09n
users. Tutorials and references for all functions.

The Atari Compendium- A total compendium of all Atari computer programming
functions, everything you wanted to know. Official
developer information.

Games are $20.00 and include original docs and box.
Calamus guide is $10, and the Atari Compendium is only $20!!

Leave mail to ABARBIERO@Delphi.com

buyer pays shipping.

>a PeeCee. <giggle> :)

Na, its a Computer....

>-Hutch- @ Fair Dinkum Tech

They have called it a Risk PC, to help it sell, but I think its just
a Acorn Archimedes and has its own OS, and a very nice GUI...

NOTE: These machines are very similar in a way to Ataries, there Full OS
is built in Rom, but they have a lot of Built in Software,
Paint Program,Basic etc, the last one that I had a look at has 2 megs of Rom,
I don't know how much this one has...

I can't remember where I found my own copy - maybe it was ftp.uni-kl.de, or cnam.cnam.fr, or clausthal.de - but after seeing the demo, I just _had to_ buy the program. It's a must for Falcon owners, especially - and my version 1.63 is perfectly in English... So: people go and get it! I trust someone wiser than I can give the details: where available, and the price (I bought mine from Fez-A-Bit Atari Messe in Berlin). Great stuff..!

: could ever be a new TOS.

Atari Corp. may not be interested in supporting the ST/TT/Falcon computer
series anymore, but quite a lot of developers have not. Perhaps they are
a source of further development of TOS in the future. After all, development
from people working in academic environments and third party companies has
played a substantial role in the past, and hopefully will continue to do
so in the future.

5301. Re: GEM programming tools

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 01:52:06 UTC
From: warwick@cs.uq.oz.au
Message-ID: <2ulbc6$8l4@uqcspe.cs.uq.oz.au>
Source record: 184668

sforseil@vub.ac.be (FORSEILLES STEPHAN) writes:

> Are they any programming tools (C libraries and so on) to program
>GEM faster (dialog boxes and menus)?

The libraries mentioned in a recent survey were:

```
-------------------------------------------------------------------------
Library name | Distribution | Author
-------------------|----------------|---------------------------------------
Enhanced GEM | Freeware | Christian_Grunenberg@s2.maus.de
FLUID | Not yet | Steve Sowerby (sms@sys.uea.ac.uk)
GEM++ | GPLed Freeware | Warwick Allison (warwick@cs.uq.oz.au)
Gemlib | Freeware | Jwahar Bammi (bammi@cadence.com)
HGT (HiSoft BASIC | Commercial | Dave Nutkins and Ofir Gal
GEM Toolkit) | | (hisoft@cix.compulink.co.uk)
Steve Woodford's | Personal use | Steve Woodford (woodford@esca.com)
Prospero C library | Commercial | ?? Does Prospero still exist ??
WinLIB PRO | Commercial | Karl 0ygard (karlo@ifi.uio.no)
| | Ken Hollis (khollis@bitsink.gbdata.com)
| | Markus Gutschke (gutschk@uni-muenster.de)
Wndhndlr | Available | Jan Kim (kim@vax.mpiz-koeln.mpg.d400.de)
-------------------------------------------------------------------------
```

The major features respondants like are:

- easy to use with their compiler and language
- amodal dialogues
- general purpose windows
- window menus
- toolbars
- popups
- easy to use / simple to understand
- comes with demo software
- free
- it doesn't enforce event driven programming (uses callbacks)
- apps only have to supply the actual redrawing code an
a function called when the closer is clicked.
- checkboxes
- lists
- scrollbars
- multi-dialog (Multi-dialog is a popup menu with an associated sub-dialog)
- hotkeys for buttons, boxchar's and checkboxes.
- enhanced editable text fields (with selection and clipboard use)
- sources are available, you can look in it
- a good example exists (sources)

- easy to patch (for strange functions)

(but of course, no library provides all of this)

The major problems respondants found with GEM libraries:

- incompatibilities between gem bindings in various compiler libaries
- don't want to use library without source code
- library needs to be properly maintained/improved with AES/VDI upgrades
- a text-editor widget would be nice
- the keyboard shortcuts use the Alt key, they should use the Ctrl key
- unfinished - lots to add yet
- requires slightly different programming from standard GEM (callbacks)
- not too AES-3D friendly in some instances
- no real documentation
- there is no documentation (not even in German)
- documentation in German
- some of the very useful features are still undocumented

Hmm... look at those last 4.

Below are the unsummarised responses. More in-depth comments and descriptions
of the libraries appear therein.

HiSoft BASIC GEM Toolkit (HGT)
Dave Nutkins and Ofir Gal
hisoft@cix.compulink.co.uk
commercial
Amodal dialogues, general purpose windows, window menus, toolbars

Heck, I don't know the author. It's the one that came with Prospero C
(and Prospero Pascal if I work on any of my older programs). I think
Prospero is down the tubes though. They didn't respond to my last
email.
Easy to use with my compiler.
I've had several problems where I've had to create my own data structures
because the ones supplied with my program didn't like the data being
passed to it by WERCS. Kept getting warnings of data type mismatch when
there was none.

Which libraries are available for C programming (including source code)?
I've seen some without source code, and I don't want to use them.

my own
me (Steve Woodford)
woodford@esca.com
[personal use only]
Maintainable 'in-house'. All 'tricks' completely understood (I wrote it!).
Lack of time to properly maintain/improve/incorporate AES/VDI upgrades.
Perhaps I should migrate to a 'standard' library........
I await the results of this survey!

Anything to ease the task of GEM programming will be welcome. I've had a
few attempts at programming for GEM but I still haven't got my head around
it yet.

(Don't know which libraries are available / standard)

GEM++ Only one of it's kind. Easy to use. Comes with demo
software. Free.
gem don't have any other library to use. Simple to understand.

GEM++ A text-editor widget would be nice. Not sure whether I
can establish multiple objects (eg: buttons) on screen
from a single RSC-object. That'd be nice too.
gem No real docs (Tim Oren...)

Enhanced GEM
Christian Grunenberg
Christian_Grunenberg@s2.maus.de
pd (?)
It provides a decent set of new objects (popups, etc)
Documentation (there is none, even in German)
The keyboard shortcuts use the Alt key, they should use the Ctrl key
It is written in the Pure C AES dialect (ob_spec is a union), which
makes it harder to port to traditional AES dialects.

my own ("wndhndlr")
myself
kim@vax.mpiz-koeln.mpg.d400.de
anyone who cares may get the source from me
(no significant distribution so far)
* it doesn't enforce event driven programming
* my apps only have to supply the actual redrawing code an
a function called when the closer is clicked.
I have to track down bugs and add stuff myself...
I should say that my library isn't really a GEM library. It's (as
one may guess from the name "wndhndlr") just a window event
handler. It can handle most window related events in a more or
less sensible, more or less user configurable way, user code is
called back upon redraw events and upon closing a window.
I've never done any documentation or made any distribution of
this stuff, but a few friends have copies so they can build other
stuff I made using the wndhndlr lib.

FLUID (my own)
Steve Sowerby
sms@sys.uea.ac.uk
Not available yet :-(
Modeless/modal dialogs in windows
Extra dialog gadgets : checkboxes, popup menus, lists, scrollbars,
multi-dialog (Multi-dialog is a popup menu with an associated sub-dialog
- as in Myriad's Preferences dialog- which is fully automated)
Hotkeys for buttons, boxchar's and checkboxes.
Enhanced editable text fields (with selection and clipboard use)

Untested (by other than me)
Unfinished - lots to add yet.
- I've only written what I've needed for Myriad so far.
Requires slightly different programming from standard GEM (callbacks)
Not too AES-3D friendly in some instances
I couldn't decipher EGEM or get it to work with Lattice C without lots of hassles, I haven't got G++ installed so GEM++ is no good yet, and frankly there were a lot of things I wanted extra to anything I'd seen so I wrote my own. Generally the problem with enhanced GEM libraries is the lack of documentation and example programs. I hope to provide this if I ever release FLUID. I think if a few people got together and designed something properly (similar to MiNTlibs development), it would be possible to produce a REALLY good library that everyone could use, thus improving the general standard of GEM programs (which can sometimes be a bit poor). Maybe you and I should get together and look at each other's stuff and see what we can come up with ? I must admit I haven't looked at GEM++ for a while. I really do plan to install G++ RSN so I might send some comments your way then. I also would like to release FLUID at some point even if its just for people to get ideas from.

GEM++
C++ is SO MUCH BETTER than C for GUI programming (and apps programming in general). I also like how you did most of the work for useful classes already... ;-)
Some of the very useful classes are still undocumented.
I'm working on a simple, small class for mouse pointers; this grew out of an idea I had... I wanted to be able to define mouse pointer objects in the RSC file.
I used to use GEMfast, mostly because it had studly things like sprintf() into a dialog box... it made things easier in C. Since I got interested in C++, I've looked at Extended GEM and several other GEM libraries for C, but I've ditched them all because they're not a C++ class library; things are just so much easier in C++ it's unreal.

E_GEM (1.20 & 1.30)
Chistian Grunenberg
Christian_Grunenberg@s2.maus.de
freeware
Sources are available , you can look in it
A good example exists (sources) : WINLUPE
Easy to use , Easy to patch (for strange functions)
No documentation
German (but for French people German/English , it is always a foreign language)
I have not tried BIG (a french product) : They claimed once that it will be part of the developper kit but ???
It seems to be too BIG , too restrictive : too much is done by the library , it is not flexible at all...
(It is of course my personnal point of view)
No, I'm working on one, but for the record, YES.

WinLIB PRO (Version 0.63Alpha as of writing)
Karl 0ygard, Ken Hollis, Markus Gutschke
karlo@ifi.uio.no, khollis@bitsink.gbdata.com, gutschk@uni-muenster.de
Commercial (planned)
It combines all of the major elements of all other previously written
library IDEAS into one major library, with new ideas and updates.
Trying to get these damned bugs fixed!
If you would like to order the base system to WinLIB PRO, it will be
available for $19.95(US) (that's an unbeatable price on ANY system for a
MULTITASKING GUI) for users of Pure C, Laser C, Lattice C, GNU C++,
Alcyon C, Heat 'n Serve C, Mark Williams C, and Turbo C.

_-_|\ warwick@cs.uq.oz.au |||||| GEM++ = C++ GEM library

A while back someone posted here that they are using Atari's RCS version 2.9. I am using v2.8 and have never seen v2.9. Can someone tell me where I can obtain it? I've looked for it on CI$ and GEnie already. What are the differences between 2.8 and 2.9?
Thanks for any help.

I had the same problem. The fix was to get rid of the PATH environmental
variable. Strange.

You might try finding a Gravis Mousestick. It is essentially a fancy analog joystick, designed to emulate the mouse to some degree. It would probably be very nice for stuff the analog joysticks are good for (mainly flight simulators). Note that normal ST switch joysticks are better for virtually all arcade type games (IMHO).

The Gravis does not specifically support the analog joystick feature of the STE, to my knowledge, so you would only be able to use it in place of the mouse. Again, this would probably be very nice for games that support mouse flying. I seem to remember that it was a bit expensive, but you might be able to find a used unit for a reasonable price.

What does it do? Is it an external host adaptor, similar to the ICD Link?
If so, the Link 2 (soon to come out, I hear) is supposed to do everything the
Link could, plus have an LED to positively show presence of termination power
and the ability to handle drives with or without parity. It supports
flopticals, fixed disks, removable disks, CDROMs, SCSI tapes, etc. etc.
The Link (and presumably the Link 2) run about $100US. How much is the
"Translator"? The ICD software is very nice, and is still being actively
developed. This is a big plus for ICD host adaptors, IMHO.

What you want is the tuw-tcp archive from :-

ftp.tu-clausthal.de:/pub/atari/telecom/tcpip

It has all the details of a pocket ethernet adapter interface and the
necessary software to run as .ACCS on the Atari. The adapter card goes
into the cartridge port, so no internal mods needed.

Cheers, Martin.

5309. Junior Office class 1 fax driver: where?

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 04:42:54 UTC
From: flinn@cs.ubc.ca
Message-ID: <2ullceINN4nk@elephant.cs.ubc.ca>
Source record: 184674

There have been recent suggestions that the Junior Office package
contains a class 1 fax driver. The package I retrieved from atari.archive
has a class 2 driver (the default), and a driver for Sierra compatible
fax-modems. I had thought that Sierra == class 1, but the documentation
for the Sierra driver explicitly states that if your modem is neither
class 2 nor Sierra compatible, but is class 1 instead, then you are out
of luck because the software does not support class 1.

Am I misunderstanding something, is there really a class 1 driver
somewhere (if so where), or were the recent suggestions in error?

Thanks,
Scott

I don't recall Atari saying it was MAKING analog joysticks
for the STE/Falcon's enhanced controller ports -- just that
the new ports CAN use analog joysticks. The joypad
controllers that come with the Jaguar are digital controllers
that use the enhanced controller port set-up. Atari Europe
is supposed to be releasing several Falcon-specific games
that use the new controller ports, but I don't know of any
STE software.

Will Dwinnell <predictor@delphi.com> wrote:

>So, what does the introduction of the Jag have on the ST (TT, Falcon, etc.)
>line from Atari?

It means Atari MAY have revenue in the future to spend
on other projects. Atari's officially discontinued
all computers except the Falcon and has said that if
they DO make a new computer, it will be Jaguar-based.

Atari's been losing millions of dollars for a number
of years now on its computers, so it HAS to focus on
the Jaguar to return the company to profitability,
which it expects to do next year -- they expect to
break even for 1994. We COMPUTER users may not like
being left out in the cold, but at this point in
time, Atari has little other choice unless they
want to run the company into bankruptcy.

Atari HAS licensed C-Lab GmbH to make Falcon-compatible
"music workstations" AND has licensed TOS out to
other companies for use in 68040 accelerators (for
the Falcon030) and possibly other clones.

Personally, I still think there's a market for under
$500 computer systems (like the STE), but then I
also think Atari's right that it would be difficult
to market to general audiences with the limited
graphics and such.

Maybe i can help you -
The ports are found in 1040STE and Falcon(!). The plugs are
15-pin-SUB-D, female. You can use standard-'VGA'-plugs, male. But you
must remove the metal-cover of the plug. The other (but expensive !)
way is to use the plugs and wires of the ATARI JAGUAR-control-pads.

```

Hi there

I've just read the issue of ATARI ST Magazine, and I noted with interest
the article outlining the existence of a new cheap SCSI cable device
called the 'Translator'. They mentioned something about a HD parity
requirement limiting the types of devices usable.

Are there any other bits of relevant limitations one should know before
running out with cash in hand to buy the sucker...

Can this device support a typical chain of SCSI devices (0-7 with CDROMS, Tape
drives etc...).
Any other information of interest would be great.

Reply to the NG for general consumption please...

Thanks

Hello there... just an inane request
here to lighten up everyone's day...

Did the programme (from... mmm... 1987?)
"Little Computer People" by Activision
appear on the ST?

This, for those that don't know, presented
you with a personalized little 'computer person'
on your screen, who you had to keep fed and
watered and so on, and in response it would
play music on a piano and write letters to you.

Simplistic and childish, yes, but I am just
curious to know if it ever existed for the
Atari ST and then of course, where could
I get a copy from???

Thanks a lot...

Peter Bates

5323. Adventure Writing Software

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 11:40:33 UTC

Message-ID: <1994Jun27.114033.6115@bradford.ac.uk>
Source record: 184687

Once again I am seeking a piece of the past...

Does anyone know if the programme
"The Professional Adventure Writing System"
(or PAWS) by Gilsoft in the UK
ever made it to the ST?

This dates back to 1986/87, and once more
I am just curious to know whether it ever
made it to the ST platform, and of course
where I could get a copy from.

Thanks once again, I am just keen to try
writing my own adventure games with that
system in mind...

Having said that, are there any systems
around now that allow you to create your
own games, of any type or genre?

Thanks...

Peter Bates

5324. Infocom Adventures

|> I may have the format wrong. Like I said, this worked once as user troyc
|> rlogin to localhost, but never when user troyc does "rlogin -l root
|> localhost". Anyone with rlogin experience please jump in.

If you invoke rlogin without a username, it defaults to the current user and
may ask for a password, but not a username. I think for security reasons
root login is disabled. So, if you invoke rlogin without a username when
you're root, you may get kicked off. However I'm not sure. I'll look at
the sources to verify this.

I noticed by the way that rlogind doesn't copy the environment. I had to
fix that and recompile it. When I login using the original version UNIXMODE
is gone, so it can't find absolute paths like /usr/bin. The shell can't
find the user's home directory so it doesn't start as a login shell.
The program "who" complains it can't find /etc/utmp and so on :-(

|> 3. As stated before, I have minix partitions on two different units. I have

|> Will NFS actually solve this problem? I tried to get NFS to work once, but
|> I couldn't. I decided it was not important at the time.

Have you tried "cp -r sourcedir destdir" or "cp -pr sourcedir destdir". The
-r option recursively copies subdirectories. The -p option keeps the original
owners, modes etc..

The program "mv" is buggy indeed. Unfortunately I can't regenerate a crash
when I *want* it to happen :(so I can't tell what goes wrong. Anyway "mv"
across filesystems shouldn't work. Some versions of "mv" behave like a "cp"
and "rm source" if the source and destination are on different filesystems.

What goes wrong with NFS? I've got NFS up and running using either 1 or 2 ST's;
even tried NFS between an ST and a Linux-PC :) Mounting local filesystems
using NFS seems pointless to me. It doesn't solve your problem as Mintnet NFS
always mounts under u:\nfs.

|> 4. The famous FTP problem. I need to get the psetid patch from someone I
|> guess. I thought it was in one of the tar file somewhere along the way
|> and I did it, but I guess not. When using FTP, I get the message: "can't
|> set uid". This sounds like I didn't do the patch, can this possibly come
|> from a missplaced passwd file? I have the anonymous account set up and I
|> get the same problem. Will minixfs incorporate the other fix mentioned,
|> which is to Gusetid or whatever, or will I have to do that myself (grep on
|> the code indicates only two or three places to change, is that right?) ?

The diffs are on the atari archive: Mint/mint-1.10-1.10h1-diffs.gz
And yes: you'll have to change minixfs.c in the minixfs source distribution.
The calls Getuid() and Getgid() have to be changed into Geteuid() and Getegid().

|> 5. Has anyone been able to recompile stcron4? I don't like it using syslog
|> nor do I want it in my /etc directory. I would rather it use the directory
|> /var/adm or /var/log or whatever. When I use gcc on the supplied makefile,
|> I get mucho errors.

I thought cron and syslog do entirely different things. Isn't cron used for
executing certain system programs at specified times? Anyway I think you can
configure where to put the syslog-messages with /etc/syslogd.conf or something
like that.

|> Things that I would like, so if you can point me to any of the following:
<some interesting programs deleted>

I would like these things too :) Especially Telnet!

Best regards,
Ronald

LCP appeared a fair bit earlier on the C64 I think but the ST version did get released and 1987 sounds about right. ISTR it also used MIDI for the bits where the guy played his piano. It was OK, no major enhancements over other versions.

5328. Mint patches & rlogin & mintos problems

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 12:55:12 UTC
From: v892307@gijsen.si.hhs.nl
Message-ID: <Cs23w1.Fqv@si.hhs.nl>
Source record: 184693

Hi,

After applying the new mint patches (mint-1.10-1.10h1-diffs.gz) I noticed Init (mintos) doesn't work too well on the serial ports. The user only gets a "login:" message, and then nothing happens. Looks like communications from the ST to the modem go well but communications from the modem to the ST go bye bye. I'll look at the diffs (and hack those just a little bit :), but maybe there's someone already familiar with this problem so I don't have to hack at all.

Also I noticed the rlogind doesn't copy the environment. I looked at the sources. They show the entire environment is replaced by a new one which only holds TERM. Is this done on purpose (for security) or what? I've edited the source and recompiled it so it copies the environment. Otherwise my UNIXMODE is gone and none of the programs recognise absolute paths like /usr/bin, /etc etc... Am I doing the right thing?

Last questions:
Is anyone writing a Mintnet-driver for the MIDI-ports?
Is it safe to connect ST's using the parallel port? Is it possible to blow up port B of the soundchip, by switching the ports on both ST's as output?

Best regards,
Ronald

|> games for the Atari?
Most are available 2nd hand. few were re-released in the Uk as budget titles by Virgin a couple of years ago. Failing that, there is a PC compelation of AFAIK all the games (text only) that is quite cheap. The data files are the same across all platforms so as long as you have at least one Infocom game, just copy over the executable and a PC data file and you should be able to play. There are also some PD runtime interpretors on some FTP sites. I think they're called Z code interpretors.

Don't think so. How about STAC? That supported graphics and text and could do quite good stuff. It was given away as a cover disk a couple of years ago - used to be about 40GBP at one point. There are a few PD writing systems as well. Again, check FTP sites and/or good PD libraries

Thanks for the correction, Dan. It's just that my experience has shown that
GFA 3.6 really does not 'like' Falcon resolutions (you really got a 'true
color' mode app running in 3.6?). Yes, you _can_ use GFA on the Falcon but
I still contend it's not the happiest combination. It works, but...

>Correctly written programs will work in any Falcon resolution.

Hey netters...

You are free to do what you want, of course, but huge .signatures like Bruce Wright's, above, really are frowned on by a lot of folks on the net. The suggested rules for .sig's are to be no MORE than 4 lines in length. The reason is that people tire of scrolling through big .sigs all the time and more importantly, some people have to PAY for their access to the nets and this stuff just adds needlessly to their cost. I have my own reasons for disliking them but that's a personal problem.

Just a request for you to consider or ignore... yer choice. :)

Thanks.

>in advance....

For fame and fortune, pick another platform.

For fun and friends, you are on the right track. :)

Send a query by mail to Atari Corporation, ATTN: Developer Support,
5000 Borregas Blvd, Sunnyvale, CA (sorry, I don't have the zip code)
and ask for information about becoming a registered developer.

There _used_ to be a two tier system... one for hobbyists and one
for those already shipping (or about to ship) a commercial product
for the Atari.

Hardware discounts are available for commercial developers but they
have lots of restrictions and can usually be beat by shopping around.

There is currently no annual fee for developer support because, well,
there isn't any developer support to be given. You are essentially on
your own, with the exception of support from private organizations
like the IAAD. Atari doesn't even publish the dev newsletter anymore.

Anyone can buy the developer kit materials but be forewarned. They
are of poor printed quality (photocopied), poorly organized, and of
limited use to most developers (unless they have totally revamped
the dev docs since last I checked, which I really doubt). All of the
dev docs used to cost $300 but I don't know what the cost is now.
Personally, I think the most valued source of info is the 'Atari
Compendium' book by Scott Sanders.

If you don't get a response from Atari you can also check with the
Independent Association of Atari Developers (IAAD) by sending an
email request for info to permit$@genie.geis.com.

Good luck,

-Hutch- @ Fair Dinkum Tech

Er... perhaps you might want to rephrase this question. What do you mean???

The Jaguar is a game system, the others are personal computers. The only
thing they have in common is the Atari name and the fact that they both
compete for the same scarce resource dollars.

I've found another recurring problem with STZip 2.5. Some times, I will click on a file and tell it to extract.... and it simply won't. In order to get it to extract, I have to select none of them and tell it to extract. If I select them all, then the same problem occurrs. Some of them won't extract. I think the last two times, they were PRG's that wouldn't extract, but I don't know if it's limited to those.

My only questions about this new SpeedoGDOS are the following:

1) Does it actually run at a respectable speed now?

2) Why the *^&^*&^ doesn't it support Calamus fonts?

3) If there is a FPU installed, does it detect it and use it, or is that pointless because of the design?

Otherwise, the instant I get the extra $50, I'm buying the upgrade. :)

H> I'm sorry you felt the need to be so hateful as it was uncalled for,
H> IMHO. It certainly encourages me to develop more for the Atari. Yeh,
H> right.

Hateful? Get real, I was being sarcastic, certainly not hateful. I have no personal feelings against you. (I hardly know you so how could I?) I was simply fed up with your negative attitude and when you failed to back up your statements with proof, you lost any credibility you might have had. And to top that you went ahead and told the world how important you are. Sorry, but I just had to react to that. Since I've been an Atari user myself for nearly a decade and, pardon my ignorance, never heard of you or your company I just couldn't believe my eyes. But I apologise if my tone was too harsh. And yes, I did read your apology and I accept it, but that was not until _after_ I read your original post and replied to it so you can't hold that against me. I'm not a medium you know.

Now, let's end this silly nonsense and do something positive for Atari instead, shall we?

5348. Laser Diablo Emulator Help.

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 17:43:12 UTC
From: daveh@netcom.com
Message-ID: <davehCs2H81.JwG@netcom.com>

Connected with my recent aquesition of an SLM805 my Mega 2 now simply does not have enough memory. Can anyone tell me how to up her to 4 Meg. I assume that I need to solder in 16 1Megx1 Rams but I also here that some resitors are needed. What are these and their value, also what value and type are the smoothing capacitors? Finally where is a good source for cheep ram (100ns is in there at the moment.)

Many Thanks,

Dave.

Funny that you both say this, as I had similar experiences too, but with 3.5" Maxell and other name boxes of 10. If I sold a box I had to check each disk myself and ensure 10 good ones or I was sure to get the box back a few days later from the (rightly) angry buyer. Then a local company started off importing container loads of blank no-name (in any color you wanted) and I stuck with those. Not only was the price ridiculously low, but I went through thousands (used and sold) with only a handful ever showing any problems. The best batches were packaged in lots of 50 with a Canadian maple leaf on the wrapper; I swear not a single failure there.

I still wonder how they made those pricey brand-name diskettes? -- hand-painted magnetic coating? :)

That was one odd ramdisk/spooler combo ;) It had "hacker" written all over it
so I never dared use it seriously.

> [...]
> So, my question is: is there a reset survivable RAMdisk WITHOUT data
> compression available?

A number. Extracted from my BBS dl-file (Dsik utility/ramdisk)...
-v-
ETERNAL.LZH 8K #____ resetproof ramdisk
FLASHD.LZH 5K #____ fast removable ramdisk
INTRAM.LZH 8K #____ ramdisk as ACC
STATIC.LZH 6K #____ yet another ramdisk
VDISK3.LZH 6K #____ German ramdisk ACC, removable
VRAMDISK.LZH 5K #____ ramdisk ACC with IMG-backup to disk, v1.1 svensk
XDISK205.LZH 23K #____ easy-to-use resetproof ramdisk
-^-
I'm not entirely sure _all_ of the above are reset-safe, but most later
versions tended to survive a warmboot.
(Rambaby was put in the general hack area...)

DD> From: amiga@hosta.dircon.co.uk (Dino Dini)
DD>
DD> It's standard procedure... some conversions of GOAL! have been
DD> handled by third parties... PC and SNES. The problem is no publisher
DD> would give an advance to cover the cost for the Jaguar, because of
DD> it's low potential sales. My estimate above would not be enough to
DD> cover 25% of the cost of a conversion.

But I thought Kick Off 3 (your game?) was already in the works for the Jaguar so I don't quite follow you. It seems to have a very large potential in sales if everything goes according to plans. Maybe the projected 500,000 units by the end of the year doesn't hold true but even half that number would make it a good investment, don't you think?

Now, if you were talking about the Falcon, I can understand your worries. But may I then be bold enough to suggest that you look into the concept of shareware? I know Llamatron (Jeff Minter) have been very successful with his Atari games in the past and this way you could probably make more money than any "big name" company could offer you since you would receive 100% of the asking price for each game sold, rather than a small fraction of it. Think about it, only 1,000 copies at 10 pounds each would earn you a respectable income of 10,000 pounds, and more importantly, a place in the center of every Atari owner's heart! :-)

And if you are worried about your status as a professional developer, I suggest that you take a good look at Id Software. I don't think anybody is questioning their professionality just because they make shareware. They are probably one of the most respected developers in the industry, thanks to successful games like Wolfenstein 3D and Doom on the PC. Or ask Jeff Minter if he feels discriminated because he's been doing shareware.

From: sccoe@ucscb.UCSC.EDU
Message-ID: <2unejn$6kv@darkstar.UCSC.EDU>
Source record: 184724

I am working on a four-player combat game in STOS, and want to use the extended joystick ports that come on the STE & Falcon. I have the STE joystick extender code, but that was made for use with a funky little interface that split each of the analog ports into two regular joystick ports (enabling 6 joysticks total). I just want to be able to use Jaguar controllers (normal analog) with the ports. Anyone have any clues/patches/ extensions or help for use with STOS? TIA!

Oh yeah, on a similar note...does anyone have the extra 2-player joystick adapter for use with the parallel port (you know, for Gauntlet II and things) I would be willing to buy one off you. cya later.

Yes. Mine is marked 1985/1986, so it must have been one of the first ST applications out there. BTW, if you leave your machine on for several days, and you fail to give your computer person food and water, he gets green in the face and writes you nasty letters, and the dog becomes mean and barky. This actually entertained myself and some dorm buddies at the time (ah, for the simple pleasures in life :-).

> Simplistic and childish, yes, but I am just
> curious to know if it ever existed for the
> Atari ST and then of course, where could
> I get a copy from???

That might be tough. I would call several Atari mail order places and see if they have one in the bargin bin, or perhaps second hand. If you need a source for such, try calling Toad Computers 1-800-448-TOAD and ordering an issue of Current Notes or ST Informer magazine (be sure to get on Toad's mailing list as well). I mention Toad specifically because I can remember the 1-800 number :-). There are at least 4 or 5 mail order places with large ST software/hardware inventory. Good luck.

I don't know about this one. However, take a peek at the index in the Programming section on atari.archive.umich.edu. There was a recently uploaded adventure game development system, whose name escapes me.

> Having said that, are there any systems
> around now that allow you to create your
> own games, of any type or genre?

STOS and STAC are probably the two biggies. STOS has compatability problems on various STs (fixable, from what I understand). I didn't hear much about STAC, but it was a similar product geared for adventure type games. There was yet another one whose name also escapes me, but I believe the recent upload Berzerk (in the Games section of atari.archive) was written with it, and the titlescreen mentions the name of the development system.

Sheesh, I feel like a historian :-). Hitchhiker's guide and LGoP were definitely made for the ST. My suggestion is the same as for Little Computer People: contact some ST mail order places and ask about their bargin bins or second hand software (or even new shrinkwrapped stuff). Also, there is a program on atari.archive.umich.edu that emulates the logic engine for any Infocom adventure. In other words, you could take the data file(s) from a PC version of the game and run it on your ST. You would probably have a better chance of finding a cheap or used PC one, as they probably sold a lot more of them. Look in the toplevel 0index file on atari.archive for this program.

5371. Spectre GCR hidden dedication page

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 22:02:24 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <2uni9g$b1b@mailer.fsu.edu>
Source record: 184737
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Here is a silly question. After doing a bit of Mac emulation last night,
I realized that while I have read about several Dave Small "hidden dedication"
pages, I had yet to actually find the one in Spectre 3.0 software. So, I
peeked around a bit, and am stumped. Does anyone know how to invoke it? I
presume it plays an unusual sample, as have his previous ones. Thanks
in advance.

For Sale:
Atari SLM 804 Laser Printer: 8pages per minute, text and graphics.
300 dots per inch resolution.
300 sheet paper tray.
Will connect to any Atari DMA port.
Atari SM 125 High Resolution Monochrome Monitor: 640x400 resolution.
12" screen.
Anti-reflective coating.
Amazingly clear picture.
Atari 520STfm Computer: Built in 3.5" double sided floppy drive.
2.5 Megabytes RAM.
RF output to Television or VCR.
Atari 520STm Computer: 1Megabyte RAM.
RF output to Television or VCR.
Atari SC 1224 Colour Monitor
Atari SF 354 Floppy Drive, Upgraded to double sided.
External drive with power supply.

Must sell. Need the money. All prices negotiable.
SLM 804 $450
SM 125 $100
SC 1224 $150
520 STm (1Meg RAM) $200
520 STfm (2.5Meg RAM, Internal Floppy Drive) $350
SF 354 DSDD Drive $50

Please call Doug at 476-4684 and leave a message; respond here;

5376. Why GOAL! is the best football game ever

Newsgroup: comp.sys.atari.st
Date: 1994-06-27 23:36:24 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199406280042.AA00297@moroder.demon.co.uk>
Source record: 184732

GOAL! may not look too impressive at first, as the fact that the players are larger than in the Kick Off series means that the game is harder to get into, and will remain difficult to play until you've mastered the art of passing the ball around while keeping half an eye on the scanner.

However, with a little perseverance, it soon becomes much easier to play than Kick Off 2 and more challenging (and rewarding) than Sensible Soccer.

Here are some of the features which only come to light after a while (or can only be mastered with a fair bit of practice), and set this game apart from the others.

+ By repeatedly pushing the joystick in one direction and releasing it, you run more slowly in that direction. When running slowly, the ball stays closer to your feet and you can change direction more easily. (I don't think you could do this with Kick Off 2, and it makes a big difference.)

+ When you're clean through on goal and shoot without trying to direct the ball, your player will automatically try to place the ball in the corner of the net. (I've never seen any other games which do this. Normally you end up shooting straight into the goalkeeper's arms, when in real life the player would have a good chance of scoring.)

+ You can stand on the ball and shield it from an opponent until one of your team-mates becomes free to receive a pass. If you take too long, the opponent will push you over and run off with the ball.

+ When taking one of your midfielders on a run down the wing, one of your forwards will move towards him in case he's going to pass the ball. If you ignore him and keep on running, the forward will change his mind and move into the penalty box to wait for a cross.

+ If you have the (computer-controlled) opposition under a good deal of pressure, and then score, they may just boot the ball straight up the field from their kick-off. (Or maybe it happens randomly - I honestly can't tell.)

+ If your opponents are leading narrowly and time is running out, they may just boot the ball towards your end of the pitch to waste time.

+ You can take long-range shots and determine how high they should be by pulling back on the joystick immediately after you kick the ball, in a similar way to applying aftertouch. It's quite tricky, and the further out you are the more likely it is to be saved (so no goals from the half-way line), but it can result in some spectacular goals.

+ You decide how many men (between 0 and 7) you want in your wall if your opponent has a free-kick near your goal.

And there are countless other subtle features that I've either forgotten or not yet identified.

I've been playing football games for over ten years - the first was International Soccer on a Commodore 64 in John Menzies - and GOAL! is currently at the top of a very long list (and likely to stay there for a few years at least).

And just for the record, I thought Sensible Soccer was better than Kick Off 2, but only for a month or so, by which time it had become far too easy. I can put a forward in goal and a couple of goalies (who run much slower) up front and still give the opposition a good kicking.

If GOAL! is the last football game to appear on the ST - well, it doesn't really matter because it would be practically impossible to improve on it.

Technical addendum:
As custom team sets are saved to an ordinary diskette, you can hack about with them with a binary editor. The game itself doesn't let you give teams a black jersey, or black stripes with black shorts, but you can if you figure out what to change in the data file. (Clue: in the ST version, strips are numbered from 0 to 5 and colours from 0 to 15, and the six bytes for home and away kits are kept together.) The (slight) down side to this is that the team name is invisible (black on black) on the screens which give you pitch, wind and referee details and match statistics..

5380. SLM 804 Laser Printing Problems (Word Writer/Geneva) (Help!)

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 00:22:31 UTC
From: ehood@convex.com
Message-ID: <2unqg7$8j3@lovecraft.convex.com>
Source record: 184742
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Problem 1:

I'm having problems getting correct printing on my SLM 804 laser printer with Word Writer. Everything will print fine for the first page, but subsequent pages get all garbled. Also, if I try to use different fonts, text gets indented after I use a font different than in slot 1 (as specified by the SETUP630.PRG). Has any one had success printing on a SLM 804 with Word Writer? Can I get a copy of your .CFG printer file if "Yes"?

Problem 2:

When Geneva is running, and I print to the laser printer (via Steno or PageStream), sometimes the printout gets messed up. For text files, the characters get all bunched. For graphics (or PageStream text), the graphics get clipped and garbled.

Any help is greatly appreciated. Please respond via e-mail if possible.

This implies that someone at Atari has been working on MiNT lately;
AFAIK, Eric's been far too busy working on the Jaguar to do more than
post an occaisional amalgamation of patches from people on the net...
Several members of the MiNT mailing list have been doing quite a lot to
expand and improve MiNT.

Naturally, their names escape me at the moment... ;-) But I appreciate
what they're doing!

I agree, that sounds really good, but I have one question: Is that the
model with or without on-disk disk caching? I remember them saying they would
come out with a cheap-o line of drives that were sans expensive SRAM chips (and
not necessarily upgradeable).

BTW, watch the extra-long lines - I didn't realize how much of your
article I was missing until I used EMACS to edit the (quotation of the)
message. Parts that wrapped around were cunning placed so that I didn't even
notice an incomplete sentence. :)

For that BBs you are putting together - what is it using and will
it have the (an?) Atari CD-ROM (the pd sampler)? Just think - you will have
to have 4 maxed out (256MB) partitions just to access all that space. What
will you do with all that space to fill (and don't tell me you'll run a
mirror site for Atari.Archive ;>)? Good reason not to get the 1.8GB drive -
you might run out of disk letter assignments before you could access all of
it. :)

>-Steve, steve.barnes@lchurch.mcd.on.ca
>
> * Origin: Logic Church, Sudbury Ont,v32b,(705)-525-1307 (FIDO 1:224/150)

PS: About the Quantums being reliable: I totally agree. The most
sturdy and consistant and fast drive I have ever seen (after 5 years as a
computer tech, and having done more than my share of Macs). The worst
problem I have ever seen them have consistantly was that old stiction problem
a few years back in the Q20s and Q40s (which they gave out a fix to). Even
then, most of the time you could bring back the drive with a deft flick of

the wrist and back up your data before the drive turned its toes to the daisies. I wish all drives died so peacefully!

Hi!.

I'm wondering if there anyone that have any information on which CD-Rom would work with my ICD-Hostadapter.. The Parity *MUST* be disabled to work with my interface.. Any suggestions?

Regards Bertil Jagard SysOp Swedish Atari Club..

CLEVELAND, OHIO is 500 miles within HALF of the population in the United States and a very LARGE population of Canada.

The CAIN Atari Fun Fest 94 will be held in Kirtland, Ohio (very close to Cleveland) and will allow Lynx and Jaguar owners to have a lot of fun! There will even be a "Cleveland Lynx-Up" where Lynx owners can bring their Lynx and game cards and comlynx with other players! Who says that you'll never get the opportunity to comlynx???

There will also be dealerships attending this show that will be more than happy go give you great dealers on game systems and game cartridges!

If you are an Atari computer gaming fanatic, not to worry! There will dealers there to supply you with all your computer gaming needs...

ALL INTERESTED ATARI DEALERSHIPS AND USER GROUPS SHOULD CONTACT THE SHOW ORGANIZERS AS SOON AS POSSIBLE! Great spaces are on a first come basis! Atari user groups are given tables for free!

PLEASE distribute this on BBSs, networks, and at your user group meetings! We want to have one heck of a gaming day! And a gaming day that might be closer to you than you think!

CAIN Atari Fun Fest 94

Central Atari Information Network
Presents
C.A.I.N. Atari Fun Fest 94
August 7, 1994 / 10:00AM to 5:00PM
Knights of Columbus Hall
7637 Chardon Road
Kirtland, OH 44094

^
* THE FIRST CLEVELAND-AREA ATARI SHOW IN YEARS!!! *
^

Free Admission!

What to See and Do!

The New Jaguar Game System!
The LYNX handheld game unit
Bring your LYNX and games to COMLYNX with other players!
The Falcon Multimedia computer
Gemulator (IBM emulator running Atari ST Software)

8-bit computers and products
16/32-bit computers and products
Portfolio palmtop computer
Meet the editors of C.A.I.N.
Classic game systems 2600/5200/7800 and games
Catalogs and brochures for Atari line of products
Atari products for sale / Plus Much More!

Table pricing per 8 foot table
$10.00 per table no electricity
$15.00 per table with one outlet

Last I heard he was programming the Jag. Atari pulled him off MiNT as they were short staffed and needed some Jag work done. He still posts to the MiNT mailing list.

5403. Re: Typing program

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 08:30:33 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <xG0xYt5.johnhechtman@delphi.com>
Source record: 184566

The question was, "Is there a shareware typing program for the ST?." The answer is YES, it's called TYPIST. It's available at least on Gopher as that's how I got my version of it. Even better, it's hard drive loadable which the Mavis Beacon program is NOT! I own both and the MB prg IS good, but requires a key disk to run it each time you use it. Needless to say, it's a pain in the a*s and I wind up working with TYPIST more. Oh, and did I mention it's also FREEWARE?! (G)

IW>Loads of games? I've _Never_ seen _any_ commercial game using more than
IW>82 tracks! (The drive in my STE will do 00 to 83 (84 tracks), and the old
IW>520STe I have here will manage 00 to 82 (83 tracks).)

Please find a disk that works ok with 84 track format. All disks now are
made for IBM compatibles and the max track there is 79. So after that is
all trial and error.

I had a SF354 that could format a disk up to track 86 and was the only
drive that could read that disk without problems. I prefer games are
written on normal or 10-sector formatted disk max 80 tracks. After that
you can't be sure.

5407. Turn OFF Mega ST Hard Drive..

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 09:58:27 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2uos83$kme@golem.wcc.govt.nz>
Source record: 184577
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have found a very simple way to turn OFF the Drive in my MEGA ST2..

I have a Floppy with ByePass Hard Drive and Cold boot set up
in the Boot Sector by using DC Format...

I also have Ataries later Ship/Park Program the 776 byte one that can be used
as a ACC...

I use the Floppy to boot up the system, this byepasses the Hard Drive,
the Ship/Park Program is used to turn OFF the Hard Drive, as a Program..

After 30 seconds or so I exit the Ship/Park program, ie, to let the
Hard Drive spin down...

This sort of works, but I end up with multible entries in my
Floppy disk directory..?

I have found one way to clear this with out causing the Hard Drive
to spin up, I just hit the reset button...

Can some one explain why I am getting multible Directory entries
with the Floppy drive...A Drive that is.....

Thanks....

>st now!

I know, I know, bad form following up on your own article...

in thinking about this, I see 2 "real" solutions. one is to hack up my
midi port to act as a second serial port and connect it to the PC. then
I just need to run a term prog on the PC to send data to my ST and
somehow redirect kbd io (bconin??) to get data from both the kbd and
the midi port.

second, locate a box that speaks rs232 on one end and mega kbd protocol
on the other.

help? pointers?

5413. Starball locks up

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 10:41:42 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <2uoup6$6u8@m1.cs.man.ac.uk>
Source record: 184582

I've had quite a few messages from people experiencing problems with Starball locking during the title screen (the blue one with the faces). So far these seem to mostly be in two groups: Mega STe, and 1040ST with TOS 1.02 or 1.2.

One thing that does need to be said is that ALL the files including the soundtracker module list MUST be there even if they aren't or don't appear to be used. I think this may cover a couple of cases.

I must admit I'm baffled as to why it runs from floppy but not from HD.

I am contacting those people who have had problems and trying to fix them. I hope by the end of next week to release a version 1.2 which should have much better compatibility and also (for the zillion people who have asked) hi-score saving.

5416. Mono monitor replacement

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 11:21:33 UTC
From: rgh93@aber.ac.uk
Message-ID: <1994Jun28.112133.5930@aber.ac.uk>
Source record: 184583

Hi all,

I have now had two SM125 mono monitors break down on me in quick succession. I do however have a monochrome hercules monitor ex- of a PC; has anyone tried to interface one of these to the Atari before? Looking at the specs (line rates) it should be possible.

Alternatively, where can I get one of my monitors (cheaply) repaired (must obviously be within UK!)?

It'd be greay if you could respond to this request by email; our server here only keeps news items for 24 hours, and I don't get time to read news that often.

Thanx.......

Rich

5418. Re: SpeedoGDOS v5.0 Announcement

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 12:01:13 UTC
From: alpldbia@w251zrz.zrz.tu-berlin.de
Message-ID: <2up3e9$f18@brachio.zrz.TU-Berlin.DE>
Source record: 184584

>My only questions about this new SpeedoGDOS are the following:
>
>1) Does it actually run at a respectable speed now?

First speed tests will be published soon according to a statement of a SpeedoGDOS developer in newsgroup atari.text (only available on MausNet). As soon as I can get hold of the results I can post them in here.

For REAL speed you might consider buying the upcoming NVDI 3 (announced for August '94 in Germany and surely soon after that in the whole wide world). It will handle Speedo- and TrueType-fonts directly, i.e. without the help of SpeedoGDOS. I'm sure it will be _very fast_ (as it already is now). On the other hand - if you need Type-1 fonts there's no other way than SpeedoGDOS 5 (of course you can increase SpeedoGDOS' speed by the help of NVDI, too).

>2) Why the *^&^*&^ doesn't it support Calamus fonts?

Calamus fonts don't have any hinting information which is needed to get a good quality output on 'normal' devices, e.g. the screen or a 300 dpi printer. Have you seen a 300 dpi print of a Calamus document? It looks awful! Calamus fonts are very good for high resolution output but not for devices an average user has got at home (OK, some people are rich enough and buy a 600 dpi laser...)

3) If there is a FPU installed, does it detect it and use it, or is that
pointless because of the design?

I don't think it uses the FPU. I will ask this question on MausNet.

Andre

5424. MiNT Answers/More Questions

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 13:41:11 UTC
From: troyc@bnr.ca
Message-ID: <2up99n$bva@bmerha64.bnr.ca>
Source record: 184589

Here are some answers I have received concerning my questions:

1. rlogin problem: probably the .rhosts file. If I am any user except root, then I can rlogin as that user (i.e. no passwords or anything). I do not seem to have the enviornment problem. However, if I am root, I cannot rlogin as anyone, let alone root. I have not tried rlogin as one regular user to another regular user account.

2. Text editor priority problem: The "Mega" patch took care of that. The "mega" patch is on atari.archive in the mint directory. It is not called the "mega" patch, I just saw someone else refer to it that way.

3. The move problem. I have not solved this, but have had some suggestions from unix gurus that we have an old version of mv. Newer version detect when it is moving across a filesystem and instead of moving the inode pointers, does essentially a copy and removes the original source copy.

4. ftp problem: The "Mega" patch fixed this. I also recompiled the minixfs to use Geteuid and Getegid just like the ftp readme says. All works fine.

Answers to Things I want:

1. Term program - Try ANSITerm - have not done this yet.

2. PPP support: "Look for Mint-Net 0.51 conatining a very, very alpha PPP driver." -- Kay Roemer

MORE QUESTIONS:

1. I can't get anonymous FTP to drop me into the ~ftp directory. Instead I get the root directory. I would guess ftpd is looking for the chroot command, which I don't have...does anyone have chroot?

2. Where do I get the latest version of the lynx program. Why is this not on atari.archive yet?

3. Has anyone compiled httpd for MiNT yet? (if anyplace it would be in the lynx archive, I guess)

4. Testing out NFS, I could only link filesystems into the /nfs directory. Is there anyway to link them into the file hierarchy the way I want them? Also, when I did mount the filesystems, I could not cd or ls on them, it did not allow me, even as root. Denied me permission. How can this be fixed? NFS may be more useful if I had more than one machine, but it would be nice to see it work and know I could set it up in the future...

Thanks,
Troy Carpenter

5429. Signum to WinWord 6.0

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 14:46:46 UTC
From: Bales_N@CIRAD.fr
Message-ID: <9406282134.AA00065@montp.cirad.fr>
Source record: 184594

CEO file contents:
Hi,

I guess WinWord uses Microsoft's RTF format so what you need is something that outputs in RTF. The only Atari program I believe does that is Marcel 2.2 a shareware word processor on the atari.archive although I've heard that there are differences between ANSI RTF used by Marcel and PC RTF (But I'm not sure)

Now, the problem is this one imports Postscript, ASCII, WordWriter, 1st Word and RTF but Signum isn't in the list. If Signum can export in one of these formats you should be done.

There are two utilities on the a.a that can convert 1st Word and Word Perfect if that can make a intermediate file.

I haven't tried all this yet but I am interested as I've just got ScriptNow which I believe uses the same format as Signum but doesn't export in anything else. Please let me know if there is some software that does this...

Bye,
Nick.

5430. Re: Why GOAL! is the best football game ever

Newsgroup: comp.sys.atari.st
Date: 1994-06-28 14:47:14 UTC
From: sjdrew@cen.ex.ac.uk
Message-ID: <Cs43qq.A3n@cen.ex.ac.uk>
Source record: 184596

Thanks to Stephen's first review, saying a debugged version was
available, I immediately sent off for GOAL by mail order. It
arrived this morning!

I haven't had time to play much, and it seemed to be working
fine, but can anyone tell me how I can find out whether this
is the fixed version. I didn't see any bugs, and there seems
to be a cup competition included, which if memory serves me
right wasn't in the original, so maybe I've got the right one.

First impression? I had time for half a game this morning,
and was beaten 8-0 which none of Dino's earlier games got
close to doing, so this looks like a great challenge.
The finishing of the computer team was painfully impressive.

One gripe. That was never a penalty ref :-)

Stephen

>profitable line of products?

Of course that's important, Will. A company needs cash flow in order to survive, obviously. My complaint lies with those individuals who are absolutely convinced that a big Jaguar success story for Atari will automatically translate into newer and better Atari desktop computers.

Atari has been losing money in its computer division for some time. The Jaguar has been a limited success and is at least paying the bills. I don't think Atari will be in much of a hurry to 'throw good money after bad' in the computer business again. I see the Jaguar as being good for Atari, but _not_ necessarily good for we Atari computer afficiandos.

But all this is just IMHO, mind you. And you KNOW what 'opinions' are like. :)

I have a listing for it on atari.archive.umich.edu. It is in
Applications/Other/typist.arc. The description is "Randy's port of a
unix typing tutorial program". While I have not seen it, the description
leads me to believe that this is not a particularly graphical application
(which Mavis Beacon is). It might still be great though, and the price is
right :-). Could this be different from the Typist you mention above? If
so, feel free to send me a copy of yours and I will put it on atari.archive.

Ups? Sounds like the silly GNU library. Are you *always* working on
drive u:? Usually rlogin must not copy the whole environment, because
rlogin starts a login-shell on the other host, which has to setup the
environment itself (via /etc/profile and .profile (Bourne Shell) or
/etc/csh.login and .login (C-Shell)).

Bye,
Knarf

Well, I don't know what it looks like on a Mac, but the animation and such
is very nice on the ST version. Sound is OK, but not spectacular (it could
have been a lot nicer with more samples, but would probably require more
than the semi-standard 1mb of memory). I particularly like the intro to the
game. Gameplay is fast and responsive. I recommend the game to anyone, as
it has both arcade and adventure characteristics.

Oh, I saw it on a PC (it had a different name, but the game was exactly the
same), and thought that the gameplay was much better on the ST (not
surprising, as this type of game works better with a non-analog joystick,
IMHO).

On atari.archive.umich.edu you can ftp typist.arc from the directory
atari/Applications/Other. It is text/terminal based, no graphics, and
takes the user thru increasingly difficult exercises.

There are four UK Atari magazines:
Atari ST Review
ST Applications
ST Format
ST User
(That is my personal preference order, too).

I think that ST Review's email is midihelp@cix.compulink.co.uk
Someone will correct me if I'm wrong.

Some of the others may be on CiX too, I suspect.

There are more recent versions of these patches on ftp.inf.tu-dresden.de
in atari/Mint/Kernel/ (a very slow site).

> command, which I don't have...does anyone have chroot?
chroot() is not a command, it should be a system call. MiNT doesn't have
this and I don't know how difficult it would be to add it.
> 2. Where do I get the latest version of the lynx program. Why is this not
> on atari.archive yet?
You get it from ftp.twi.tudelft.nl:/pub/atari/
It's not yet on a.a. because it has a very unpolished quality; you need
too many hacks to use it. But please try it out, tell me if you get the
terminfo setup to work and mail me any suggestions for packaging it
nicely. (note that you need terminfo which comes with ncurses which you
need because without it you can't have bold and underline).
> 3. Has anyone compiled httpd for MiNT yet? (if anyplace it would be in the
> lynx archive, I guess)
Httpd has nothing to do with www _clients_. I have no use for a daemon
myself but seeing the leaps Mint-Net is making it may be doable to just
compile it. My port of lynx works on local files, so you don't need a
daemon for that. Only when you want to play with cgi-bin scripts.
Try ftp.ncsa.uiuc.edu and look for httpd.

Greetings,

> I guess WinWord uses Microsoft's RTF format so what you need is something that
> outputs in RTF. The only Atari program I believe does that is Marcel 2.2 a

Papyrus can import and export RTF and can read Signum!2 directly (actually
by an external converter that's automatically launched)

> shareware word processor on the atari.archive although I've heard that there
> are differences between ANSI RTF used by Marcel and PC RTF (But I'm not sure)

It's true. The character encoding is described in the RTF, so the reading
program has to do the conversion. I don't know the Windows version, but
MS word 5.something failed miserably at importing DOS-encoded Umlauts on the mac
- another example of poor programming by Microsoft. After all they invented RTF.

I am interested in hearing from anybody who has experimented with low-end,
"Garage-VR" stuff on the Atari line og
computers. I am working on a system for using Sega-3D glasses and cheapo
Mattel Powergloves. I saw some code that had originally been written on
an ST (and had since been converted into ugly PC code), written by some
german guy as a "mouse-control" program for the powerglove.
So if anyone has, or knows where I can find, some code for interpreting
powergloves or displaying 3D sega images for the ST/FAlcon/whatever,
please email me. TIA.

] "Little Computer People" by Activision
] appear on the ST?

It was a fair bit older than 1987! :)

It was ported to the ST by (I think) Activision in about '87. And it was
just as slow as the 8-bit version! :) Wierd 'game'!

I wouldn't have a clue where you'd get it from though!

>some extras coming on a HD disk. Soo.. it's probably worth upgrading.
>Utopos II is coming out for the Amiga 1200 commercially, and if Stardust
>succeeds on the STe they might be making Utopos II for the STe aswell.
>Pity they don't trust they can get Utopos II sold well on the Ste, but
>oh well, what can you do?

Wrong... You can reach Aggression trought the net, I just have no time
to read news very often...

At least I (Lance), Owl and 7th son have e-mail addresses at Helsinki
University of Technology. 7th son reads his e-mail only occasionally,
but I and Owl try to do it at least once a week.

addresses are:
kkallio@vipunen.hut.fi (Lance)
shlehtin@vipunen.hut.fi (Owl)

I suppose that Qwerty and Cube have also internet access, but as
we use our BBS for most communication, I haven't bothered to ask.
You can also call Necronomicon BBS +358-0-3882710 (24h, 2400-14.4k)
for fastest contact with us.

Utopos II has almost nothing to do with original Utopos, it's more like a
combined strategy and action game, where action sequences are similar
to original Utopos. The final goal in the game is to conquer the universe,
nothing less. The game will feature some unique techniques, like fractal
compression of the tracks, making _256_ 1024*512 pix. 256 colour tracks to
fit onto a single disk. We are now working with it's graphics with Owl,
and promise to fill every byte the coder gives to us with most awesome gfx...

Currently Utopos II is coded in a way that it can be compiled also on Falcon
by just changing a couple of include-files, so it may very well appear
also on it. The future of STe (and Amiga 500) versions is very uncertain
due to the memory limitations.

>But I thought Kick Off 3 (your game?) was already in the works for the Jaguar

Typo. Sorry, I meant to say Falcon. And **please bare in mind** that I left ANCO and took my sequel to Kick Off 2 with me. ANCO have the rights to the name "Kick Off" and have decided to do a sequel themselves. "Kick Off 3" has nothing to do with me at all. My sequel to my previous effort (Kick Off 2) has been released an numerous formats, mostly called "GOAL!" and published by Virgin Interactive Entertainment.

>Now, if you were talking about the Falcon, I can understand your worries. But

>Atari owner's heart! :-)

It would not be worth my while for 10,000 pounds, because in the time it would take I could be working on something else, like my sequel to Player-Manager.

>And if you are worried about your status as a professional developer, I suggest
>that you take a good look at Id Software. I don't think anybody is questioning

>discriminated because he's been doing shareware.

Not worried about status at all... just about getting income. A publisher will guarantee a certain amount that will cover the devlopment period of a game. You don't get that with shareware. But I'd love to hear from any who have direct first hand experience of selling software by this method. As it stands I am far from convinced about it.

wells_s@ix.wcc.govt.nz (Steve Wells) writes:

>Stardust?

Stardust is a STe-conversion of an Amiga game Stardust. It is converted
by Wiztom and 7th son. Stardust is based on a traditional Asteroids-idea,
but all the rocks and ships are raytraced, there's plenty of weapons,
it runs at 25 Hz, and really pushes the blitter to the limit. (As there
is a 16-colour picture on which all the action happens.)

There are also some warp-sequences between the levels, something you have
never seen on STe. Imagine yourself flying through a tunnel with texture-
mapped walls and dozens of ray-traced stones and mines flying towards you
at enermous speed... Stones can be shot, and they explode, but mines are
more dangerous - you can only try to avoid collision...

As Amiga Stradust had 32-colours, we were forced to reduce the amount of
colours to 16, but that's almost the only thing that changed.

There is some screenshots of it in the latest ST-format.

Btw, all our STe-games will naturally be Falcon-compatible.

>If Utopos II is commercial, I'm not paying more money for it!

It's commercial, but really worth paying. Read my previous article...

I don't know for sure. That's just what I heard from some IAAD folks.
Eric's a multi-talented guy (as is quite evident from MiNT and MTOS)
so I'm sure they could put his skills to good use somehow.

Speaking of the Jaguar... where could I buy one (most likely mail
order) if I was so inclined? Does Toad have them?

Here is an updated list of things for sale:

NEW:
3.5" SCSI case subsystem
External SCSI ID
SCSI passthrough
built in fan
Nice vertical case with stand
Very compact and suitable for Atari or Mac needs

Bought it to sell a 3.5" drive I owned... sold the drive loose
so now I do not need the case! Used for about one hour. Original
packing and warranty.

NOW for $70

Just saw the same cased advertised on sale for $99

Legends Of Valour- Well, if you can't have DOOM! on your Atari,
this smooth scrolling fantasy role playing game
will carry you through! Multiple missions, full
character interaction and enough versatility to
keep you interested.

Only $15
I can send you the review of this game UUEncoded if you like.

MegaSTe for sale!

This is a complete system with 4 megs of RAM, and a new 50MB Hard drive.
For anyone unfamiliar with the specs of this system please leave me mail
I will send you the story on it.

I just checked the whole system and it all works in like new condition.

Only $500

Or leave your offer...

Atari monochrome monitor with TILT-SWIVEL base! OEM base made to
fit the SM124.

Only $60

Atari color monitor (1224) This is the high quality JVC monitor, it
was my spare, and little used.

Only $75

That'd be TADS, the Text Adventure Development System.

There's a C++ class library called AMS that Warwick Allison did a while
ago on atari.archive... He doesn't like it anymore :-), but it's still
available.

Eric's busy working on Jaguar stuff... he's still overseeing the MiNT
project, but most of the "real" work on MiNT is being done by hackers on
the MiNT mailing list. Eric is still the brains behind the MiNT source
archives that appear on atari.archive periodically...

> My only questions about this new SpeedoGDOS are the following:
>
> 1) Does it actually run at a respectable speed now?

Very few things run at a respectable speed on an 8Mhz 68000 (MicroEMACS
does, Ultima V does, POV-Ray sure doesn't)...

> 2) Why the *^&^*&^ doesn't it support Calamus fonts?

Calamus fonts don't support hinting, and they're even more non-standard
than Speedo fonts... After listening to all the complaints about
Speedo, would _you_ want to support another one-vendor-only font
"standard"?

> 3) If there is a FPU installed, does it detect it and use it, or is that
> pointless because of the design?

I sure hope it does (no that I have an FPU in my ST, but TT and Falcon
owners with them would certainly benefit from the extra boost)...

In a previous article, sjdrew@cen.ex.ac.uk (S.J.Drew) says:
+I haven't had time to play much, and it seemed to be working
+fine, but can anyone tell me how I can find out whether this
+is the fixed version. I didn't see any bugs, and there seems
+to be a cup competition included, which if memory serves me
+right wasn't in the original, so maybe I've got the right one.

The cup competition was in the original ST version, but two immediate differences spring to mind. The pitch in the fixed version has no stripes, and the printing on the actual diskette is yellow (I think the original was white).

Well, it'll happily run in 1MB - but to actually use it to view big stuff
like a jpeg you'll need 2MBs minimum, probably 4MBs.

I bought it when it first came out back in 1990 or so... it was pretty fun. \
Me and a friend spend a good month or so playing it after school :) Most of
it is cinmatic adventure type stuff, but then end has both a reflex shooting
part and a run through a maze while timed part. I enjoyed it a lot and wish
they made a sequel or something similar.

>Eric is now doing Jaguar work like everyone else at Atari. ;-)

Makes you wonder, doesn't it. I mean, why have an OS guru working
on an OS-less machine?

I can only assume that Atari haven't given up on MultiTOS entirely and
are keeping Eric around, even if he isn't perhaps the best person for the
job he is doing. (Not that I'm saying he isn't - just that there is no
reason he should be)

So it's good for MTOS prospects, really.

Correct, you want some 100n de-coupling caps too and you may need to add
the missing resistor's - these are usually 68 ohm ones but check what
are already installed now on the existing RAS/CAS lines.

You're lucky, I'm grafting in 32 256*4 rams into a Mega ST-1 and I've
had to do some additional decoding for it (should've bought the Mega-2).

Cheers, Martin.

I have a 520STFM (with internal single sided drive and mouse)
for sale for $60 (this price includes shipping)
This deal should be worth it for parts alone.

The 520STFM includes a built in TV modulator for use on
a TV or VCR.

I also still have a 520ST with external single sided SF354
disk drive for $50 including shipping. This includes the
mouse.

Starball resets the status of the Falcon's sound system, and so should run OK even if everything else has been scrambled. That being said, my system has FPATCH2 in the boot folder, and it has been known to occasionally lose bits of the sound (sometimes the FX and sometimes the soundtracker modules).

Remember that no soundtracker modules are actually supplied, you need to read the readme file for information on how to set up your own.

Dave

The Jaguar, of course, has enough code in its start-up ROM
so that it knows what to do with the cartridge port/etc.
It just doesn't have any system calls for software to use
in order to run (which is what an OS is).

Thanks to me pestering ICD, (Yes HUTCH I know I am a Pest) they have now posted
there none Pro version of there Utils Version 6.5.5 on GEnie..

If you don't have a ICD host adapter in your system, you will be unable
to install the none Pro version..

So to cover that problem ICD now sell there Utils for people that don't
have a ICD host adapter, you also get CleanUp and the SCSI Util
Program with the Pro version, plus Support for CD Roms, Flopticals etc..

HUTCH, yes TOM did reply to me on GEnie, it must have been your help,
or Gods will....?

>they're called Z code interpretors.

These interpreters can be found at the interactive fiction (i.e. adventure
game) FTP archive ftp.gmd.de. They run PC (or Mac or ...) Infocom text
games all right.
One interpreter that runs all Infocom text adventures and that is compiled
for Atari ST can be found in

/if-archive/infocom/interpreters/itf/atari.itf-bin.zoo

If you don't have a program for unpacking a ZOO file, look in directory

/if-archive/download-tools/atari/

The archive is mirrored some place within the US. The README files
tell where.

P.D.Bates@bradford.ac.uk (P.D.Bates) writes:

[Question about "The Professional Adventure Writing System" deleted
as I know nothing about that system]

>Having said that, are there any systems
>around now that allow you to create your
>own games, of any type or genre?

Sure, there is a whole range of adventure game writing systems available
through the net. The most popular ones are TADS and Inform. I give a
short description below (note: I am using TADS on my Atari ST myself and
haven't really tried Inform).

TADS: Object oriented, somewhat C-like (but no pointers), very
versatile. Shareware $40. Registrated users get a very
good printed manual. Creates machine-independent .GAM files
- the same file can be run on any machine that runs TADS,
which is quite a lot. The support of the language itself
is quite good, but the Atari ST version is maintained on a
volounteer basis which means little machine-specific support.

Inform: C-like, more lowlevel than TADS (for instance, the parser
is not an integrated part of the language; a parser is
part of the standard library, though). Freeware and comes
with source code in ANSI C. Creates files in the format
of the old Infocom adventures, which means that the games
can be played on any machine that has an infocom interpreter
on it. Such interpreters are availble on the net.

For more detailed descriptions and descriptions of several other
systems see the "Authoring Systems FAQ".

Where to find the stuff: The interactive fiction (i.e. adventure game)
FTP archive at ftp.gmd.de:

TADS: /if-archive/programming/tads/
Inform: /if-archive/programming/inform/
Infocom interpreters: /if-archive/infocom/interpreters/
FAQs: /if-archive/info/

The archive also has lots of other stuff. It is mirrored somewhere in
the US - the README files tell where.

And finally: Come and join us on rec.arts.int-fiction, a newsgroup
for adventure game authors (and would-be adventure game authors like
myself). Not to be confused with the rec.games.int-fiction, a newsgroup

abouth _playing_ adventure games.

See you there!

/Lars

Hutch,
While TOAD does sell Jaguars I would recommend your local Electronic Boutiques, or Babbages. Going through Toad would be supporting an Atari dealer, but I would like to encourage non-traditional Atari outlets to continue carrying ANY Atari products.

I have not seen any "deals" on the Jaguar, and the shipping would probably be more than the state tax you'd end up paying. Besides if there is a problem with the unit then you have to pay shipping to return it, instead of a quick exchange at the local store. Though both Babbages, and both Electronic Boutiques, here in the Raleigh NC area report that no one has return a Jaguar for any reason. They just wish they could get more Jaguars and more games.

Sorry. To the best of my knowledge there is no such animal. I think
there was an April Fools type joke about it a long time ago. Don't
know about any German magazine article, though.

It could certainly be a useful product for many people but I doubt
the economic viability of developing it.

> This is not a *flame* at Atari users, but at the inept management at Atari.
> They seem to think that *we* let them down, but, in truth, it is they. I fear
> that the Falcon, which is an *awesome* machine on paper, will also suffer from
> their (the Tramiels') shortsightedness.

It already has. The Falcon is pretty much a niche machine in these days,
with no obvious growth path - although it's a very good machine.

> Have they ever left a company in better shape than when they found it???

Certainly they have. Jack Tramiel led Commodore into the home-computing
era, and when he left, they had a very strong position. Commodore screwed
up after Jack Tramiel left. Atari at that time was struggling, as it is
now, so you cannot really say the situation has become worse 8-)

I think the fundamental problem is this: The ST line was a major success
with younger people, students, and the hacking crowd. These people
gave Atari incredible support in terms of software and hardware
extensions. Atari, however, first went for the biggies to push
the ST line. Remember the rumors about Borland and Microsoft producing
software for Atari computers? Remember WordPerfect for the Atari?
They never finished these projects, for reasons unknown to me,
but I figure it had a lot to do with Atari's reputation and the
preliminary status of the early system software.

After a while, Atari found itself in a position where no major
software house ported software to the new platform but myriads
of small new software houses and freelance programmers wrote tons
of utilities, programming tools, and application software. Most of
the software was way ahead of comparable PC software, and everything
seemed to be fine. In this situation, Atari seems to have forgotten
to use the market momentum to convince major software houses
to produce for the ST. Instead, they relied on the semi-professional
marketing skills of newly founded software "companies", and they
didn't even support them properly.

The other thing they forgot was system software. In the timeframe
from 1985 to 1989, TOS essentially stood still. (TOS 1.02 was no
major step in my eyes, just a few bug fixes and blitter support.)
In 1985, TOS was a technological leader; only the MacOS could
rival the graphical user interface. In 1989, when TOS 1.04 was
released, Mac software had leapfrogged software on the ST, and
the PC world was catching up. Today, TOS is even inferior
in lots of ways to WinDoze. Note that the only *major* TOS
development (MiNT) came from outside Atari!

So my major complaint about Atari as a customer is that they
didn't find professional support from major software houses.
My problem as a software developer was lack of support through
the system software.

Well, that's how I see things now. A lot of you will disagree
or add their own "favorite" reason why they think Atari screwed
up.

Nevertheless, I also enjoyed working with ST and TT computers
and still do. The scary thing today is, however, that history
might repeat itself with the Jaguar. The major software houses
don't seem to have a lot of trust into the Jaguar's success
and are reluctant to sign on as a developer. I hope my
impression is wrong.

> Until they demonstrate good management, I will never buy another new Atari.

You're not the only one. Although I am a big Atari fan and like
the Falcon's features a lot, I still haven't bought one. I *might*
be tempted to buy a Jag+CD, though. But then, that's also what I
said about the Falcon when it was released.

I used to for quite a while. It's not bad during the day, but at night in a
dark room I had to turn the bright & contrast way down.

>
>I use a light grey border, a pastel blue background and black lettering since
>I've got my STE... Ah yes and a pastel yellow MKM_II cone-shaped mouse.

Yes, That's what I have now too. I also made the window background the red
color with a *real* light checkered pattern so the red is barely visible.

I also use the windows color CPX with Xcontrol to set the colors of all my
window decorations so the active window is quite pleasant.

I still have to turn the bright and contrast way down in a dark room, though.

An old PD thing was about some years back. AGT. Pretty basic text stuff but seemed reasonably competent. Included sample sources for a couple of different (more or less complete) adventures. From my archives:

```
[-v-<snip>-v-]
-v- AGT-documents
AGTBLURB.ARC 20K #____ overview of AGT system
AGT_DOC.ARC 121K #____ all doc-files for AGT system
AGT_READ.TXT 5K #____ introtext for following AGT:SRC
-v- complete packs AGT (compiler and run-time)
AGTST.ARC 136K #____ Adventure Game Toolkit v1.19 Comp/Run
-v- more or less complete sources AGT
ALIC_SRC.ARC 24K #____ AGT: Alice in Wonderland
CAVE_SRC.ARC 69K #____ AGT: 'original' Adventure (C&W)
CRUS_SRC.ARC 42K #____ AGT: Crusade
ELF_SRC.ARC 44K #____ AGT: elves
FABL_SRC.ARC 7K #____ AGT: Fable
GHOS_SRC.ARC 21K #____ AGT: Ghosttown
PARA_SRC.ARC 27K #____ AGT: Paranoia-adventure
QUES_SRC.ARC 34K #____ AGT: Quest (magic and D&D)
SAMP_SRC.ARC 10K #____ AGT: various
SQUY_SRC.ARC 57K #____ AGT
UNDE_SRC.ARC 20K #____ AGT: Underground
[-^-<snap>-^-]
```

Sources are flat ACSII with keywords for various functions.
(Yes, I really should repack these as ZIP or LZH someday :)

Let me know of you want these (UUE or disk).

5501. ESS-Code v 6.1 available

Newsgroup: comp.sys.atari.st
Date: 1994-06-29 16:58:48 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cs64DJ.vo@westminster.ac.uk>
Source record: 184464

```
ESS-Code is now up to version 6.1
---------------------------------

Program date: 29 June, 1994

This can be found at:

micros.hensa.ac.uk

under

micros/atari/tos/n/n172

as file

esscd61.lzh, and n172.msg

=====================================8<================================
This program was designed to allow computer users to exchange binary
binary data. This can be done by converting the binary file to an ASCII
file, then converting the ASCII file back to its original binary state
after transmission.

ESS-Code is now Shareware. The last free version is 5.08, and can be found
in package n109.

Users who register ESS-Code will receive a disk with the latest
version of ESS-Code (optimized), and a registered (optimized,
personalized) version of MasterBrowse (which also includes MasterPrint,
AutoDate, ACC-Pad, ShadowTerm II, and a coupon for a free catalog from
Suzy B's Software and a $3 credit toward the purchase of a disk from
the Suzy B's Software collection).

The continued development of ESS-Code depends _solely_ on user
contributions; if no such contributions are received, this
application will not be developed further.

[ESS-Code 6.0: June 16, 1994]

MIME conversion method is rapidly replacing all other
conversion methods; it is not as fast as some, but it
generates very compact output and is extremely
reliable. The MIME conversion method is supported on the
UNIX, Amiga, Macintosh, IBM, and Atari computer
platforms.

NEW FEATURE: ESS-Code now has an expanded command line interface; the
previous command line interface is still present (for use
as an installed application). The new method consists of
```

eight possible commands; the commands are not case
sensitive, but the commands and arguments must appear in
exactly the order shown below:
-uud [source] [destination file]
-btoa [source] [destination file]
-atob [source] [destination file]
-ship [source] [destination file]
-unship [destination file] [source] [source] [...]
-mime [source] [destination file]
-unmime [source] [destination file]

For control over the segment size, use the "SEGSIZE"
command line mode, it will set the segment size
according to the value in that environment variable.

NEW FEATURE: The entire ESS-Code manual is now available at any time
from within ESS-Code (if the ST-Guide accessory is
installed). By making the online help external, the
overall program size is reduced and the quality of the
online help is vastly improved. If you want to move the
"ESSCODE.HYP" file out of the ESS-Code directory, you
must define the "ESSHELP" environment variable; it should
contain the full pathname of "ESSCODE.HYP".

[ESS-Code 6.1: June 29, 1994]

NEW FEATURE: ESS-Code can now handle MIME-Encode/MIME-Decode requests
from the operating system, or when ESS-Code is called as
an installed application. Valid extensions for a
MIME-Encoded file are ".M", ".MIM", & ".MIME" (case
sensitive).

==========

**********Please note**********
This version does not claim to be Falcon compatible, even though it works in
640x480x16 Rez on the Falcon. If you would like a fully Falcon compatible
version, then you may either wait for the next release, or use version 5.08.

Also, I, Denesh Bhabuta, am now handling UK registrations for this program.
Please read the documents for more information.

5502. MasterBrowse v4.5 available

Newsgroup: comp.sys.atari.st
Date: 1994-06-29 17:00:42 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cs64Gp.y8@westminster.ac.uk>
Source record: 184465

```
MasterBrowse is now up to version 4.5
-------------------------------------

Program date: 29 June, 1994

available from

micros.hensa.ac.uk

under

micros/atari/tos/n/n114

as file:

mb45_bin.lzh

and n114.msg

A description follows:

============================8<===============================================
MasterBrowse is a GEM text file viewer, packed with features. For a
complete list, see the documentation inside the archive, or see descriptions
to previous versions on the archive.

See the documentation for an extensive list of bug fixes, and new features.
Below is a list of new features and bug fixes from version 4.4

* Version 4.5 June 29, 1994 (w\ Installation Program V.4.5)

NEW FEATURE: MasterBrowse now has even more powerful windowed dialog box
editing capabilities. The following keys can be used inside
a windowed dialog box:

UNDO = Exit (Cancel)
Return = Exit (Done)
TAB = Next Editable Field
Control + TAB = Previous Editable Field
Shift + Left Arrow = Start Of Editable Field
Shift + Right Arrow = End Of Editable Field
Shift + Up Arrow = First Editable Field
Shift + Down Arrow = Last Editable Field
Control + Left Arrow = Start Of Previous Word
Control + Right Arrow = Start Of Next Word
Shift + Backspace = Delete From Start Of Field
Shift + Delete = Delete To End Of Field
Alternate + [UNDERLINED LETTER] = This will exit the dialog
box as if you had clicked on
```

the button containing the
underlined letter.

NEW FEATURE: MasterBrowse now has context sensitive online help, if you
use the ST-Guide accessory. If the accessory is installed
on your system, pressing the Shift + HELP key will cause
MasterBrowse to instruct ST-Guide to open a window with
information relavent to your current position. Since all
of the information is external, this option does not affect
the size of MasterBrowse at all, or how much memory it
uses. The entire MasterBrowse manual is available (accessed
by entering the help system while you are NOT in a dialog
box).

NEW FEATURE: When marking a block, the SHIFT key can be used to "continue"
a previously marked block. This means that the start of the
block will remain the same, and you are only adjusting where
it ends.

NEW FEATURE: MasterBrowse now has an "Edit" menu; "Clip Block" is now
"Copy" and "Open Clipboard" is now "Paste". This change
was implemented so that MasterBrowse would be more compliant
with existing (and future) standards.

NEW FEATURE: MasterBrowse now has a "Delete" option under the "Edit"
menu; it will delete the SCRAP.TXT file inside the
clipboard folder.

NEW FEATURE: The keyboard shortcut manager has been completely rewritten;
you can now add and remove keypresses at will, and change the
keyboard shortcut for ANY action (not just menu entries).
MasterBrowse no longer makes any distinction between the
left shift key and the right shift key. The interface to
the keyboard shortcut manager has also been rewritten; it is
now much more user-friendly!

BUG FIX: Selecting "Skip" in the colour configuration dialog box will
no longer cause MasterBrowse to set that colour to white.

BUG FIX: If the text or background colour is chnged, the window affected
is now completely redrawn.

NEW FEATURE: MasterBrowse now has a push/pop position feature; this can be
thought of as a temporary bookmark. You "push" (set) the
position, then "pop" (unset and move to) the position. This
is much faster than setting a bookmark because it does not
cause a dialog box to appear on the screen.

==========

*******Please note*******

I, Denesh Bhabuta, now support this program in the UK. Regsitrations may be
sent to me. For more information, see the documentation.

The author is also quite active on the GEM-LIST, a mailing list for the discussion of standards for GEM, and thus you may relax in the knowledge, that his programs are bound to follow some standardisation for now, and the future.

TEMPUS WORD (only available in a GERMAN version) reads and writes RTF, too.
Exporting these files for WINWORD works fine.

This won't be possible. For virtual memory you need an Atari with 68030,
i.e. TT or Falcon or an ST with an TT/Falcon compatible 68030 add-on, e.g.
PAK/3. With a normal ST virtual memory is absolutely impossible.

But that's not what you understand under "virtual memory". VMEM is a library
for some kind of virtual memory that only works for those programs which are
written to use this library and which were linked with this library.
You can't use it for general purpose virtual memory.

I'm looking for a (relatively) cheap TT mono monitor.

A week or two ago I was told about a Princeton LM 301. Steve parker (sbparker@harold.ukmail.NET) gave me a US address and phone number for Princeton Graphics, but I called and it's now some secretarial service or something.

So, has anyone in the US heard (recently) of these people?

Or, does any one here know of another monitor that will work with the TT?

thanks.

: Calamus fonts don't have any hinting information which is needed to get a good quality output on 'normal' devices, e.g. the screen or a 300 dpi printer. Have you seen a 300 dpi print of a Calamus document? It looks awful! Calamus fonts are very good for high resolution output but not for devices an average user has got at home (OK, some people are rich enough and buy a 600 dpi laser...)

Calamus fonts seem to appear OK on the computer screen when using Calamus....
or at least that's what I recall.

You know, when I wrote a font driver for bitmapped fonts, I created a
MFDB for a monochrome area large enough for the WHOLE LINE, imaged it, then
blitted it to the screen. I found this to be MUCH faster than blitting each
character individually to the screen. For SpeedoGDOS to be fast, it would
have to do the same, pulling characters from its cache. Does it?

5513. Why GOAL! won't work under TOS 2.06 (and up?)

Newsgroup: comp.sys.atari.st
Date: 1994-06-29 20:18:00 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199406292118.AA00316@moroder.demon.co.uk>
Source record: 184476

Virgin have used Rob Northen's copy protection, which deliberately corrupts a sector on track 0 on the disk. This means the drive can't be opened into a window on the desktop so you can't copy the files. Very clever indeed.

Unfortunately, while earlier versions of TOS blithely ignore the error (or don't ever find out about it) and head straight for the auto folder, TOS 2.06 grinds away for a while and produces an ordinary desktop. It's highly probable that later TOS versions will do the same.

Thus, GOAL! probably won't work on a Falcon, and it doesn't appear to be Dino Dini's fault.

Needless to say, this goes for other games which use the same copy protection. (Although if it saves Falcon owners from Bart vs The World, then every cloud really does have a silver lining.)

: The Jaguar, of course, has enough code in its start-up ROM
: so that it knows what to do with the cartridge port/etc.
: It just doesn't have any system calls for software to use
: in order to run (which is what an OS is).

This doesn't leave much room for improvement in some areas. You couldn't replace one of the processors or change the I/O structure without EVERYTHING breaking. Without an OS, the Jag's going to find itself backed into a corner. There will come a point when having to use the hardware directly will make it impossible for Atari to make a necessary improvement.

Case in point: The serial chip in the ST. It took Atari forever to replace it because they didn't have any OS support for control signals. Everything had to bang on the hardware. And, as expected, telecom software (like Aladdin) broke on the Falcon. If there had been OS support, the problem wouldn't have arisen.

Since the Jag has no OS support of any kind, Atari's going to be majorly stuck.

Anupam-

GDOS stands for Graphics Device Operating System. It's main purpose is to load fonts and device drivers, and make sure that output from programs which use GDOS gets to the right device. This reduces the program's memory requirements by allowing "modules" which any program can use for each device.

However, GDOS tends to slow down your system. So much that the slow up is easily visible. At boot up, GDOS displays a message that it is installed. The latest versions are 1.0 and 1.1 and display "GDOS RELEASE 1.x Installed." If you use Atari GDOS, I recommend one of these two versions; the earlier versions of GDOS generally had some problems.

The best replacement which I've seen, and which I use, is Codehead Software's G+Plus, which will automatically load different configuration files (for GDOS, called ASSIGN.SYS) when you run a program. It also won't slow your system down, and can even speed up some screen opperations.

Atari's latest version is called SpeedoGDOS, which also can change configuration at any time, has excellent support for vector (outline) fonts, and generally is considered by everyone to be and excellent product. If you have the memory (1Mb, I think), this is probably the way to go.

CodeHead's address was, last time I checked, P.O. Box 74090 Los Angeles, CA 90004, phone (213)386-5735. If this is wrong, someone please correct me!

Hope this helps!

Hi everyone!

I've been using Warp9 v3.75 since it came out, and have been very happy with the quality of the program and the increase in speed (I used QuickST before that!). Lately, though, I've been thinking about getting NVDI, since that's quite a bit faster. Before I go out and drop the money, though, I was hoping someone could answer some questions I've had about it.

1) How much faster (% increase) is NVDI than Warp9?
2) My system is a (U.S.) MegaSTE4 with external hard drive and TOS 2.06. Has anyone experienced any problems with this set up?
3) Compatibility issues. Does it work with the following programs (in order of importance):
DC DataDiet v2.1
Protect 6
Mouse-Ka-Mania II
Pagestream 2.2b
Storm v1.2
WordUp
WordWriter ST
STZip 2.6 (and ARC and LZH)
Graphics programs (PAD, Degas, Arabesque, CAD 3D2)

Anyone have any problems with it? Please let me know.

Thanks in advance!

NeoDesk saves the color of the screen in it's LOWDESK.INF or MEDDESK.INF files. To change the colors, use Xcontrol to change the colors to what you like, then hit control-X to save the configuration. Your new colors will be used upon startup.

5521. Atari ST hardware *** FOR SALE *** UPDATE

Newsgroup: comp.sys.atari.st
Date: 1994-06-29 22:12:39 UTC
From: apratt@taligent.com
Message-ID: <Cs6J14.7n8@taligent.com>
Source record: 184492

I have sold some of the equipment I mentioned last time, but here is what I have left:

One Megafile 60 (60MB hard disk in the Mega-style case). ACSI interface, cables included. Works with any ST or TT, not just Megas.

One 520ST hand-upgraded to 1MB. External floppy drive (DS but not HD). Power supplies, cables, etc.

Two monitors, one color and one monochrome. The mono monitor fades when there isn't enough white in the picture (like a white-on-black text-mode screen with just a shell prompt on it). There is a one-resistor fix to this that many people, including obryan@gumby.cc.wmich.edu (Mark O'Bryan), can tell you about.

A 1200-baud external modem for any computer. You need a null modem cable to use it, and it's pretty cheap & dumb. AT command set, but not completely Hayes-compatible, and the special signals (DTR, DSR, RTS/CTS) probably don't work the way you expect.

All cables, power supplies, etc.

An Epson FX-100 wide-carriage dot-matrix printer. Parallel interface. With cable.

No reasonable offer refused. You pay shipping or come pick it up: I'm in San Mateo, California; I could bring the stuff to work in Cupertino if that's better for you. I'm not looking to make a lot of money on this, just to be sure this stuff goes to good homes.

You can E-mail me at the address below, or call at (408) 777-5253 (work). I may or may not see a reply to this posting.

> standard setup on a standard colour monitor.

Virtually all of my work is done on an SM124 mono unit. Once you have worked with one of these high res paper-white mono units, you can never go back :-). I cannot imagine doing DTP, telecommunications, etc. on a color monitor anymore. These are available fairly cheap, and I would put it right after a hard disk in terms of "Things to get to enhance the usefulness of your ST/STE". Just my $0.02.

Oh, pastel green, a bright red, and I tone down the white to a lower value than default. Neodesk is the king, IMHO. I have not worked from the GEM desktop (for any length of time) in years. Neo uses a lot of patterns to give texture and "apparent" colors to the desktop, and IMHO looks a lot nicer in color than the GEM desktop. Another $0.02.

Was he that old..??

I did read a good write up in Byte some time back, and Atari had a option on
it, if the ST did not work out, but it was not that cheap, some $2000us plus
from memory, also the only Computer to win the Design Council Award of N.Y.
sort of a PC with great graphics chips....

I did see them being sold of in Byte for some $260us..

I think it was independant to the Amiga...

>so in the future.

True, but how many people have time to finish everything? There are around
140 names on the MiNT mailing list, and about 5 people regularly submitting
comments, bug reports, or new code. You would think, with full source code to
MiNT available, more people would have produced interesting additions by now.
(This is certainly not meant to discount what *has* come about. Kay's MiNTNet
being probably the most visible new development, e.g., is incredibly cool.
And I do the best I can manage, but it's hard to split time between MiNT
hacking, Digital Storefront hacking, Atari.Archive management, other
administrivia, stuff at JPL, and of course my full time job here...)

We really need someone to step forward right and commit: "I am going to
develop a non-blocking SCSI/ACSI/DMA device driver for MiNT." Once we get this,
we can drastically improve MiNT's multitasking performance, revamp the MinixFS,
write a *good* TOSFS, and develop other new FS drivers that will all offer
better performance than what we've got now. We can support SCSI ethernet,
SCSI terminal multiplexors, or anything else as well. But first, someone has
to get the basic driver code down, and it hasn't happened yet.

Source record: 184498

Some old news on Jeff Minter:

He wrote the commercial game Andies Attack, a Stargate/Defender clone for the ST back in 1987/88. I have this game and it is pretty. It is also one of the few games that uses rasters effectively to give the impression of more than 16 colors on the ST. It runs on all STs and STe and worth a look if you can find it in a bargain bin somewhere.

BTW, I've seen Tempest 2000 on a friend's Jaguar and thought it pretty nice for this kind of game. Tempest is just not my kind of game...

Message-ID: <58zTJoA.ari2550@delphi.com>
Source record: 184499

Yes, GEMVIEW can convert standard Atari .IMGs to .GIF 87a or .TIFF formats. You must make sure you have at least version 3.01 and that you have installed it correctly.

GEMVIEW does an admirable job of converting images. However, be warned that the program compresses the colormap of the source image prior to conversion. This causes images to transfer properly but causes the individual color palette register values to be different. If you need to keep the actually palette locations the same, don't use this program!

Otherwise, this is one of the most powerful image utilities for any PC platform.

From: xuri@aol.com
Message-ID: <2uti7c$dj3@search01.news.aol.com>
Source record: 184406

Can somebody help me out? I've got a 1040 ST(f) (*not* fm) with 1meg installed, a color monitor, and a pretty good Seikosha 24 pin printer gathering dust in the top of my closet.

I run a Mac at home and PCs at work and I really want to do something with the Atari.

I apologize for my ignorance, I can't seem to find archives of this newsgroup so I'll just have to ask some dumb FAQ questions:

1) Is there a US supplier of parts/upgrades/software for this machine that I should know about?

2) I seem to remember a company that made a RISC/transputer that plugged into the cartridge slot (this was prior to the Abaq). Is anyone still doing that?

3) Is it likely to be worth my time and money to turn the 1040 into a PC clone?

4) Whatever happened to David Ahl?

5) Whatever happened to TechSpecialties?

Thanx. Unsolicited information is also solicited. Direct email replies preferred (I don't get this group on my regular newsreader).

While I agree that G+Plus is vastly better than the Atari GDOS, NVDI is
IMHO the best. In addition to accelerating GEM text and graphics, NVDI
also provides a built in GDOS. One can use GDOS fonts in place of the
system fonts with NVDI's GDOS as well. So, instead of putting money toward
G+Plus, I suggest you pay a bit more and get the best GDOS and the best
graphics acceleration you can get for the ST (IMHO). Actually, the cost of
G+Plus and Warp9 (strange, both Codehead products, and both almost but not
quite as nice as NVDI) together would approach NVDI's cost. Just my $0.02.

I have a feeling that integer arithmetic is used for all calculations,
so an FPU doesn't help.

Will Speedo 5.0 (and NVDI 3.0) have extra calls for the different font
formats, or will the Speedo fonts calls be used? I'm thinking of stuff
like vqt_fontheader() and suchlike, which are (obviously?) dependent
on the font being a Speedo one.

GhostScript will use any Type1 font.
You can get lots of fonts for ATM (Adobe Type Manager) look at the
windows / OS/2 font directory on any ftp-server.

You can get at least a full set of TimesNewRoman and Helvetica.
Baskerville and Garamond are available in Regular and Italic.

i renamed a file on a normal tos partition, i don't know why, but there went something wrong. the file should be called edi_vort.doc, but i got edi_vort..do. how can i delete or rename this file? under gem it's not visible (because of the ..) only when i type ls in the tcsh it's showed.
i tried rm edi_vort..do, but it didn't work.

any idea?

5541. Starball - how to donate

Newsgroup: comp.sys.atari.st
Date: 1994-06-30 08:25:03 UTC
From: oldcornd@cs.man.ac.uk
Message-ID: <2utvgv$98d@m1.cs.man.ac.uk>
Source record: 184411

I've had a lot of questions about how to donate for Starball, I should have been a bit more clear in the readme. The best way to do this is to write a cheque with an amount in 'pounds sterling' on it, and send that to me. My bank can then worry about all the details of currency exchange (and if I organise myself to pay them in in the right numbers I don't get charged much/anything).

Another clarification: there is currently no other bits of Starball which donating will get you, it's not a DOOM-type where you will be sent extended game play stuff. However I can send back a disk with the source code on for those programmers out there... but I warn you it is rather heavy going!

Thanks

Try this in tcsh:

rm edi_vort.*

This should pass the asterisk down to GEMDOS where it will match ".do".
Make sure that you don't have other files beginning with "edi_vort".

5544. Dorfman Report..

Newsgroup: comp.sys.atari.st
Date: 1994-06-30 09:07:13 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <2uu201$h86@golem.wcc.govt.nz>
Source record: 184414

Well I cut this out from [rec.games.video.atari]

Dan Dorfman on the Dorfman report on CNBC said at 1:25 pm today that the
Jag is a flop.

The Dorfman report had a segment on Atari corp. called Hot air:mangement hype.
Dorfman states that the Jag is a flop and has not lived upto Atari' sales
forecasting. He predicts that Atari will have zero earnings in 1994 and that
the stock also could reach zero too. He also state that Atari may not be in
business much longer

The figures shown in the report.

Atari had sales of $28 million in 1993. Dorfman stated that an earlier
statement by Sam Tramiel said Atari would have 200 million in sales in 1994 and
that 500,000 Jags would be sold in 1994. He said that Atari would not come
close to these figures. He saids that Atari management hyped the Jag and over
stated the success of the Jag earlier. He received a call from Sam Tramiel
stating that Atari will reach those figures in 1995. Dorfman is not buying
that bull.

Well HUTCH time to get out your Gum Boots, may be you should buy
a Acorn Risc PC, less Risc than a Jag or Atari...:-), or may
be you should write a book on how to live with a dying Atari..:-)..

Since you say you're involved with 525.PRG, I thought I'd
mention that several applications that support .WAV files
don't like .WAV files created by 525 (e.g. S.A.M. -- of which
525 also won't load S.A.M.-created .WAVs due to them
being saved as 0-channel samples -- and even SOX chokes
on them). I've also heard a few PC programs don't like
525-created .WAV files from others.

Also, have you considered adding sample rate conversion to
525??? It would be MUCH easier doing all of that in a
nice GEM environment rather than have to deal with messy
CLIs (not to mention HORRIBLE conversion!) with SOX.

>instead of the TV.

Standard VGA/SVGA monitors cannot be used on the ST. You
have to buy a special 'multiscan' monitor that will
support the STs video output. STs, for color modes,
require a monitor that syncs down to 15kHz horizontally --
most VGA/SVGA monitors have a minimum of 30kHz horizontal
scan rate. There are very few such monitors that sync
low enough for the ST, but a few that do include:

NEC MultiSync II/2A (some problems have been reported, though)
NEC MultiSync 3D (your BEST choice!)
Princeton Ultra 1400
Acer 7015 (I think that's the right model # anyway!)

However, most of those are no longer made, so you have to
locate used/refurbished ones in many cases.

Hello,

Does anybody know if there is a (shareware/freeware!) emulation program
available to be able to run Atari ST(e) programs on a Macintosh 680x0
system, and if there is where to find it?

Message-ID: <2uuma0$1h3@kralizec.zeta.org.au>
Source record: 184423

I am running an Atari 520 St with 2mB RAM, using C-LAB
Notator Creator Sequencing software and Unitor Sync.
I am experiencing crashing problems which only occur
just after initil loading. The computer crashes when I
go to save or load after changing disks after loading
the program.
However once the program is up and running after a
few attempts, it will run for days without problems,
until I switch it off and have to load the program again?
I have tried all new midi leads, unplugging and cleaning
connections to the sync. unit and new versions of the
software.
Does anyone have any ideas?

Please email replies to jeffcox@Kralizec.zeta.org.au

I have seen references to Starbal being packed with LZH. The copy that I got was packed with ZIP. What files are in the real version? Maybe I'm missing a file in the package that I got.

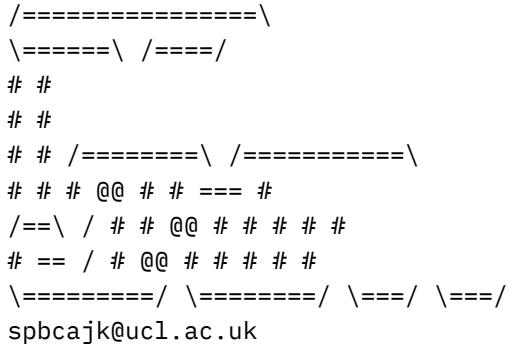
There is, as ever, another side to this coin; if you want to see how to sicken off the hackers, board-freaks and wire-heads who write the great games (see Jeff Minter, Eugene Williams, David Bell etc) have a look at the 3DO developers docs; most of the good stuff is NDAed so I won't repeat it, but amongst other things, they demand that no 3DO developer tries to reverse-engineer or otherwise hack the OS; the development specs require you to write fully OS-compliant code rather than hitting the metal.

Now, as a sometime ARM hacker as well as an Atari one, I can safely say that it's probably all done with SWIs. But is the programmer allowed to hack these in order to better fit his code to the hardware (eg prioritise loops so they use the hardware efficiently.) It would appear not (I await an answer from 3DO on this one so don't quote me in a month's time) but, unless they've provided a top quality optimising compiler for the development system (which, incidentally, is 68k based rather than ARM based - strange :-) anyone who wants to produce effects not specifically allowed for is going to have to break the rules.

Now, unlike the ST/TT/Falcon lineup, where a certain amount of product development over the years is only to be expected, the Jag is a video game console; is anybody out there still unaware of this. ITS A TOY, LIKE A NES, SNES, MASTER SYSTEM, MEGADRIVE etc. The hardware is released in a finished state; it don't need no OS fixes 'cos it ain't got no OS (worth speaking of); and the specs are going to stay cast in concrete until it's replaced by the next whizz-bang model (we've had Panther and Jaguar - what next (Puma's out :) possibly Cheetah - runs very fast and doesn't fall over :) After all, if you buy a new phone, does it require an interface stack to work, or does it implement all its phone-like capabilities directly in hardware?

Cheers



spbcajk@ucl.ac.uk

But even if it had an OS of some kind, I suspect that games developers would
not use it; they didn't for STs in general. Games programmers will always
be looking for (and often finding) faster ways of doing things, so they
bypass the OS.

Sorry, as we have discussed many times in the past, there is no such
software, shareware/freeware/commercial or otherwise. Too bad, too, as
I would love to be able to run Atari software on a fast PowerMac. Mac
DOS, Windoze, and Atari programs all running on one platform and at
acceptable speeds & compatability would definitely be way cool. ;-)

I understand that Mac MiNT allows one to run _some_ TOS and TTP programs
on a Mac, but that's about it. I've never tried it so I can't confirm it.

Message-ID: <1994Jun30.162714.8322@boojum.lanl.gov>
Source record: 184427

My old 520ST has not seen any use for over a year so it's time to recycle
it into the hands of someone else who might enjoy it. This is the FM model
with TOS 1.0, built-in DSDD drive, TV modulator, mouse, and upgraded to 1Mb.
Low 'miles' (generally only used for compatability testing), works great.
Don't need it anymore since I have a Falcon and other machines.

Best offer.

There is absolutely NO support for PS or EPS import or export in
Calamus SL. By paying extra for the Bridge Module ($150 in the US, don't
know the UK price), you can get PS output. It still does not seem to get
full PostScript support (eg still no support for Type 1 fonts).

5562. Grocery Lister...Updated Information

Newsgroup: comp.sys.atari.st
Date: 1994-06-30 16:44:51 UTC
From: vctec@westminster.ac.uk
Message-ID: <Cs7yE9.uJ@westminster.ac.uk>
Source record: 184431

Please note that you are now able to regsiter for this program in the UK. Details below, which will then be followed by a short description of the program.

There is an updated version of The Grocery Lister available, however, the version number remains the same. The only difference in the package is that there is an extra text file, informing users how and where to register.

Sysops, please upload, and replace your versions with this one, available at:

micros.hensa.ac.uk

micros/atari/tos/n/n178/grocry42.zip

Registration Information for The Grocery Lister v4.2

Date: 30 June, 1994

Contents:
UK Registrations
US Registrations

---- Effective Immediately ----------

Denesh Bhabuta (Danny) is now handling shareware registrations of The Grocery Lister in the United Kingdom. You can now register with UK Pounds as described below and recieve registration codes directly from Danny.

To register:

Send 12 Pounds Registration fee to Denesh Bhabuta
Dept. Hoekstraa
CyberSTrider
Add 4 Pounds for disk version 203 Parr Lane
Add 4 Pounds for printed manual Unsworth
Bury
Lancashire
BL9 8JW

Please add 2 pounds handling fee if registering from overseas.

Make cheques and Postal orders in Pounds Sterling, payable to Denesh Bhabuta.

For more info:

Tel: (061) 796 8311 / 5864

e-mail: danny@micros.hensa.ac.uk
D.Bhabuta@cent1.lancs.ac.uk
soon: from July: dbhabuta@cix.compulink.co.uk

In the North America you can register with the author as follows:

Send $15.00 US Registration fee to Randy Hoekstraa
3414 Norwood Circle
Add $ 5.00 US for disk version Richardson, Texas 75082

Please add $3.00 US handling fee if registering from overseas.

For more info: e-mail: R.HOEKSTRA1@geine.geis.com

The Grocery Lister is a household utility program that allows you to compile a list of grocery items complete with current price and total estimated cost. The Grocery Lister can be used to determine approximately how much you will spend at the store if you know the items that you need. It can also be used as a budget tool to allow you to select the items you most need or want if you only have a fixed amount to spend. With a small amount of database maintenance work each time you buy groceries you will be able to maintain a fairly accurate file of the items which you regularly purchase. This file can be very useful to remind you of items which you may need as you compile your grocery list. Finally, for those who have 'errand boys' do the shopping, The Grocery Lister will generate a very neat and easy to read printout of the current grocery list.

In addition to the basic grocery list function described above, The Grocery Lister has the following advanced features:

- Easy-to-use, mouse driven, multiple-windowed GEM interface.

- A single grocery database file can have grocery item information including item name, category, location, coupon or sale flag, a taxable flag, and a price for up to 4 stores. This is in addition to a 20 character item name and 20 character category.

- As items are added to the list, the current active store is tagged to that item. When the list is printed, items are grouped by store with a subtotal for each store. By loading in additional grocery files, a list for up to 10 different stores can be generated.

- An option can be set to automatically tag the item with the store with the lowest price, making price shopping very easy.

- User assignable default file names for automatic loading of the grocery file, grocery list, and ASCII file when the program is first started.

- Taxable status for each item to indicate if sales tax should be added to the total when the item is added to the grocery list. Plus, an option to automatically make all items taxable.

- A coupon reminder field for each item to indicate when you have a reminder.

- Independently sorted grocery list and grocery file by either item name, category, or location. Items sorted by location make it easy to find everything at the store because you don't have to search up and down the list to make sure you didn't miss anything on that aisle. Everything on that aisle is right there in one group on the list.

- Commands to merge both grocery lists and files to make database maintenance easier.

- Define a category or location list of up to 100 entries to easily add to an item when editing.

- A special list of staples (or any items that regularly appear in your shopping list) that can be merged into the current list with a single command.

- Flexible printer options allowing for complete control of the fields to be printed, two column printing, print to disk, and user defined printer codes.

- ASCII file viewing for looking at notes, recipes, etc. while compiling your grocery list.

==========

Download and enjoy..... 8->

Danny.

I believe it is the case that one receives Andes Attack when Llamatron is
registered. Llamasoft is still in operation, and sell most of the other
Minter products for 5 pounds each (including some of the formerly commercial
ones, as I understand it)! Here are the products I know about:

Sheep in Space - first ST game by Minter, not sure if it is available
Defender II - awesome commercial defender clone, quite hard, doesn't like my
MegaSTE, but seems to work on ST/MegaST/STE.
Super Gridrunner - space shoot'em up, not sure what it looks like.
Photon Storm - Space shoot'em up, overhead view, quite hard.
Llamatron - Robotron clone, the best!, available from atari.archive.umich.edu
Andes Attack - Defender clone, mentioned above.
Revenge of the Mutant Camels - sideways scrolling shoot'em up, excellent with
one or two players (simultaneous), available from a.a.u.e

Colorspace - non-game, interactive graphic demo (or Light Synthesizer, as
he calls it), available from a.a.u.e
Trip-A-Tron - non-game, complete light synth system, can coordinate other
machines via MIDI ports, incredible graphics, very cool.

If anyone knows of any other Minter products for the ST, please post or email
(I want to complete my collection)! I am most curious about any other games
he wrote while working for ARC. All the ones available from a.a.u.e are
shareware, and all require a color monitor.

Now that I have my CD drive up and running, I am looking for two things
that I have heard mention of:

1) An interface program that lets you access the articles, sounds, graphics
etc. of the Compton-CD. Does anyone have the email address of
"that guy" who was working on this project?

2) A program that will control the CD to play music through the computw
(preferably a desk accessory or multi-tasking compatable one). Supposedly,
Dave Troy of Toad fame has one on his BBS. If anyone has the number of
this BBS, please email it to me.

TIA! CYA!

From my experience, it is more compatible than Quick ST and Warp 9. Out
of the list you gave, I know from personal experience that it is OK with
PageStream 2.2b, STzip, Arc, Lharc. The only program I have that does not
get on with NVDI is the driver for the Tabby graphics tablet.

|> "that guy" who was working on this project?

Hi there! I am that guy :)

I recently (10 days ago) released the demo version for Compton's M.O.S.T.
discs onto GEnie. The demo version lets you display articles, and perform
searches on the CD-Rom. Support for pictures, the dictionary, and special
tables is in the registered version.

Sounds are proving to be more trouble than they are worth. (Compton's
has two sound formats, one of which is causing me headaches right now.)

Support for Compton's Interactive Encyclopedia for Windows is being
worked on in my (not so) copious spare time.

I uploaded the demo version to a.a.u.e, but it seems to not be there
anymore. (hmmm)

|>
|> 2) A program that will control the CD to play music through the computw
|> (preferably a desk accessory or multi-tasking compatable one). Supposedly,
|> Dave Troy of Toad fame has one on his BBS. If anyone has the number of
|> this BBS, please email it to me.
|>
|> TIA! CYA!
|>

I also have a program that will play audio CD's on a SCSI-II CD-Rom.
It is Multi-TOS friendly, and I want some time to add desk-ACC support.

Sort of one stop shopping :)

Brian

P.S. I can also suplly you with my own MiNT cdrom driver, if you need to
use either the Pioneer 601 or 604 six disc changer.

Average: 248% Average: 223%
Graphics: 309% Graphics: 274%
CPU: 98% CPU: 96%

The key line to note is the VDI Graphics. NVDI is obviously the winner
there, and quite close to Warp9 in the other categories. If you do anything
that used GEM graphics (DTP would be a good example), NVDI is the clear choice.

> 2) My system is a (U.S.) MegaSTE4 with external hard drive and TOS 2.06.
> Has anyone experienced any problems with this set up?

That is what the figures above were generated on. I have no problems with
NVDI. It is great!

> 3) Compatibility issues. Does it work with the following programs (in
> order of importance):
> DC DataDiet v2.1
> Protect 6
> Mouse-Ka-Mania II
> Pagestream 2.2b
> Storm v1.2
> WordUp
> WordWriter ST
> STZip 2.6 (and ARC and LZH)
> Graphics programs (PAD, Degas, Arabesque, CAD 3D2)

I can vouch for PageStream, MKMII, Storm, Zip, and DEGAS Elite. In fact, I
think you might be hard pressed to find anything that does not work with
NVDI (I'm sure there are exceptions, but very very few).

> Anyone have any problems with it? Please let me know.

First, note that NVDI is not only a screen accelerator, but also a replacement
for GDOS. Thus, NVDI is roughly equivalent to Warp9 and G+Plus combined, which
brings the price difference down a bit. Also, NVDI is extremely robust.
I cannot attribute any errors or crashes to NVDI. In fact, after having used
NVDI for a couple of months (previously I used Warp9), my "weird crashes"
essentially went to zero and I felt confident enough to enable write caching
in the ICD hard drive software. Never before did I feel comfortable doing
so, as I would manage to crash or lock up my machine every two or three times
I used it. I went through the entire chain of accelerators (TurboST, QuickST,
Warp9, and NVDI), and NVDI is definitely the most compatible there is. My
advice would be to buy it immediately (actually, you might wait until the
recently announced v3.0 hits the shelves, but you get the idea).

G+Plus does have some features that NVDI's GDOS does not. However, the NVDI
GDOS is very fast. It is quite nice to have GDOS "around all the time"
(I used to only enable it when I needed it, to save boot time). One feature
of the NVDI is that one can use GDOS fonts in place of system fonts. This
works much better than my old method of using Neodesk's fontload.prg to replace
the system fonts.

Warp9 provides some neat extras, the main one being the screen saver modules.
I do miss these, but I make do with BeforeDawn (a shareware product) which
is almost as good. In some ways it is better, but the selection of savers
for it is limited. Both Warp9 and NVDI provide mouse acceleration, but
NVDI does not allow any fancy configuring of it (my version 2.11 does not,
at least), unlike Warp9. NVDI has few configurable options (about 5 or 6
buttons in the configuration acc), so I don't find myself playing with it
(as I did with Warp9, a lot :-). It is just there, and it just works.

I don't want to seem as though I am slamming the Codeheads. Warp9 and
G+Plus served me well for years, and I don't regret buying them. However,
I do feel that NVDI is superior to Warp9, and I have not found any reason to
go back to G+Plus either. I would really like to see the Codeheads release
the Warp9 screensaver as a separate application (Falcon compatible, as NVDI
seems to be very common on Falcon systems). I would buy it in a second!

The above is IMHO, direct flames elsewhere.

5571. 3D stereogram things

Newsgroup: comp.sys.atari.st
Date: 1994-06-30 20:57:16 UTC
From: ben@sound.demon.co.uk
Message-ID: <300694215716.gem7g@sound.demon.co.uk>
Source record: 184351

Does anyone know if there's a program for the ST that lets you create
those 3D stereograms? A mate of mine says he /thinks/ there is, but
he's not sure. An ftp site and directory would be useful,
Thanks,

> He asks:it s possible to expand the Ram

You should be able to buy a kit to expand the memory. My STFM1040 now
has 4meg of RAM and it certainly is worth the money / effort.
It was easy to fit as my kit came with full instructions. It had to be
plugged on to 2 of the chips on the motherboard and takes its power
from the internal floppy disk drive. Also the old 1meg of memory on
the motherboard had to be powered down.
I find it interesting that my STFM now runs coooler with the 4meg SIMMS
I fitted than it did with the built in 1meg...

> and it s possible to install an SCSI-Harddisk?

Again - you should be able to buy an interface. I believe that the
one I use is made in Germany (GESoft) You also need a case and a
power supply.

> Sorry for my bad English!!!

It's fine - just hope you can understand mine :)

He describes the Atari connector as:

It is an SC1224 monitor, and the pins are as follows:
The plug is circular, with a notch in it. Holding the notch so it is
straight up(12 oclock), there are 3 rows of 4 pins, and a 13th pin centered
and directly below the three rows of four.(6 oclock)

The Mac side has a DB-25 25-pin connector.

Until next time...

Don't know where you could get it from, but it *was* released on the ST,
although nowhere near as fun as it was on the C64 disk version...

>the same is true for Compuserve but I don't know for sure.

The only way I can think of transfering large binary files is by
uuencodation..., because of the way their forums work (not like the at times
chaotic ftp sites) also for $$ reasons, you need to have an account there
to upload anything really (or download).

You can however telnet into compuserve.com as well (not ftp), and if you
have an account with CIS down or upload that way as well..CIS also has 14.4k
support, large files on Genie are usually always a pain, I hope this changes
soon.

Cheers

Yat
